| Filter Dynamic Updates on Spokes       | When selected, enables the creation of a redistribution list that filters all dynamic routing updates on the spokes. This forces the spoke devices to advertise (populate on the hub device) only their own protected subnets and not other IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Tunnel Parameters Tab</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Tunnel IP                              | <p>Select the required option to specify the GRE or GRE Dynamic IP tunnel interface IP address.</p> <ul style="list-style-type: none"> <li>• <b>Use Physical Interface</b>—When selected, uses the private IP address of the tunnel taken from the protected network.</li> <li>• <b>Use Subnet</b>—When selected, uses the tunnel IP address taken from an IP range. This is the default.</li> </ul> <p>In the Subnet field, enter the private IP address including the unique subnet mask (default is 1.1.1.0/24).</p> <p>If you are also configuring a dial backup interface, enter its subnet in the Dial Backup Subnet field provided (default is 1.1.2.0/24).</p> <p><b>Note</b> In most cases, when you use a subnet to specify a GRE tunnel interface IP address, Security Manager creates a loopback interface on the device which is used for the tunnel IP address. If the device belongs to a VPN topology whose configurations were discovered by Security Manager, and you configure an IP address directly on the device's GRE tunnel, Security Manager keeps that configuration and does not create a loopback interface on the device. However, a loopback is always configured on a hub in a VPN topology; in a hub-and-spoke VPN topology with multiple hubs, a loopback interface is also configured on the spokes.</p> <ul style="list-style-type: none"> <li>• <b>Use Loopback Interface</b>—When selected, uses the tunnel IP address taken from an existing loopback interface. In the Role field, enter the name of the interface role object that defines the loopback interface name, or click <b>Select</b> to select it from a list or to create a new object.</li> </ul> <p><b>Note</b> To view the new GRE tunnel or loopback interfaces in the Router Interfaces page, you must rediscover the device inventory details after successfully deploying the VPN to the device.</p> |

**Table 26-1** GRE Modes Page for GRE or GRE Dynamic IP VPNs (Continued)

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configure Unique Tunnel Source for each Tunnel | <p>When enabled, each GRE tunnel interface in the VPN is assigned a unique tunnel source. In the <b>Tunnel Source IP Range</b> field, enter a subnet IP to be used as tunnel sources.</p> <p><b>Note</b> When enabled, this feature is set for all GRE tunnel interfaces in the VPN. If you want to assign a specific tunnel source for an interface, use the Peers policy to configure the endpoints for the desired devices; see <a href="#">Defining the Endpoints and Protected Networks, page 24-33</a>.</p>                                                                                                                                                                                                                              |
| Tunnel Source IP Range (GRE Dynamic IP only.)  | <p>The private IP address including the unique subnet mask that supports the loopback for GRE. The GRE tunnel interface has an IP address (inside tunnel IP address) which is taken from a loopback interface that Security Manager creates specifically for this purpose.</p> <p>When a spoke has a dynamic IP address, there is no fixed GRE tunnel source address (to be used by the GRE tunnel on the spoke side) or destination address (to be used by the GRE tunnel on the hub side). Therefore, Security Manager creates additional loopback interfaces on the hub and the spoke to use as the GRE tunnel endpoints. You must specify a subnet from which Security Manager can allocate an IP address for the loopback interfaces.</p> |
| Enable IP Multicast                            | <p>When selected, enables multicast transmissions across your GRE tunnels. IP multicast delivers application source traffic to multiple receivers without burdening the source or the receivers, while using a minimum of network bandwidth.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Rendezvous Point                               | <p>Only available if you selected the Enable IP Multicast check box.</p> <p>If required, you can enter the IP address of the interface that will serve as the rendezvous point (RP) for multicast transmission. Sources send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |

## Dynamic Multipoint VPNs (DMVPN)

Dynamic Multipoint VPN (DMVPN) is a hub-and-spoke VPN technology that enables better scaling of large and small IPsec VPNs by combining generic routing encapsulation (GRE) tunnels, IP Security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP) routing.

This section contains the following topics:

- [Understanding DMVPN, page 26-10](#)
- [Configuring DMVPN, page 26-12](#)
- [Configuring GRE Modes for DMVPN, page 26-12](#)
- [Configuring Large Scale DMVPNs, page 26-16](#)
- [Configuring Server Load Balancing in Large Scale DMVPN, page 26-17](#)

## Understanding DMVPN

Dynamic Multipoint VPN (DMVPN) enables better scaling of large and small IPsec VPNs by combining generic routing encapsulation (GRE) tunnels, IP Security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP) routing. (For information about large scale DMVPNs, see [Configuring Large Scale DMVPNs, page 26-16](#).)

Security Manager supports DMVPN using the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes. In addition, On-Demand Routing (ODR) is supported. ODR is not a routing protocol. It may be used in a hub-and-spoke VPN topology when the spoke routers do not connect to any router other than the hub. If you are running dynamic protocols, ODR is not suitable for your network environment.

You can use DMVPN on a hub-and-spoke VPN topology only with devices running Cisco IOS Software release 12.3T devices and later, or ASRs running Cisco IOS XE Software 2.x or later (known as 12.2(33)XNA+ in Security Manager). DMVPN is not supported on Catalyst VPN Services Module devices or on High Availability (HA) groups. If your device does not support DMVPN, use GRE dynamic IP to configure GRE for dynamically addressed spokes. See [Understanding GRE Configuration for Dynamically Addressed Spokes, page 26-5](#).

The following topics provide more overview information on DMVPN:

- [Enabling Spoke-to-Spoke Connections in DMVPN Topologies, page 26-10](#)
- [Advantages of DMVPN with GRE, page 26-11](#)

The following documents on Cisco.com explain DMVPN in further detail:

- [Cisco Dynamic Multipoint VPN: Simple and Secure Branch-to-Branch Communications](#)—Explains DMVPN technology and where and why you would use it. This data sheet explains the technologies used with DMVPN and the benefits derived from those technologies.
- [Migrating from Dynamic Multipoint VPN Phase 2 to Phase 3](#)—Explains the difference between phase 2 and phase 3 spoke-to-spoke connections. Creating spoke-to-spoke connections is a configuration option with DMVPN. Phase 3 uses shortcut switching enhancements to increase network performance and scalability.
- Additional white papers and presentations are available at [http://www.cisco.com/en/US/products/ps6658/prod\\_literature.html](http://www.cisco.com/en/US/products/ps6658/prod_literature.html).

## Enabling Spoke-to-Spoke Connections in DMVPN Topologies

You can use DMVPN to essentially create a full-mesh VPN, in which traditional hub-and-spoke connectivity is supplemented by dynamically-created IPsec tunnels directly between the spokes. With direct spoke-to-spoke tunnels, traffic between remote sites does not need to traverse the hub; this eliminates additional delays and conserves WAN bandwidth. Spoke-to-spoke capability is supported in a single-hub or multihub environment. Multihub deployments provide increased spoke-to-spoke resiliency and redundancy.

You can use the 80:20 traffic rule to determine whether to use a pure hub-and-spoke topology or to allow direct spoke-to-spoke connections:

- If 80 percent or more of the traffic from the spokes are directed into the hub network itself, deploy the hub-and-spoke model.
- If more than 20 percent of the traffic is meant for other spokes, consider the spoke-to-spoke model.

For networks with a high volume of IP Multicast traffic, the hub-and-spoke model is usually preferred.

When you configure the GRE Modes policy for a DMVPN, you can elect to allow spokes to create these direct connections. You must select the DMVPN phase to use for these connections:

- **Phase 2**—Spoke to spoke connections go through regional hubs and routing protocol updates from hubs to spokes are not summarized.
- **Phase 3 (Default)**—Spokes can create direct connections with each other and routing updates from hubs to spokes are summarized. This option allows the greatest scalability and reduces latency. Devices must run IOS Software release 12.4(6)T or higher; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or higher. Security Manager automatically creates a phase 2 configuration for devices running a lower OS version.

For more information on configuring the GRE Modes policy, see [Configuring GRE Modes for DMVPN, page 26-12](#).

## Advantages of DMVPN with GRE

Using DMVPN with GRE provides the following advantages:

- **Simplified GRE configuration on the hub**

With GRE, a tunnel is configured on the hub for each connected spoke. With GRE + DMVPN, only one tunnel is configured for all the connected spokes.

- **Support for dynamically addressed spokes**

When using GRE, the physical interface IP address of the spoke routers must be configured as the GRE tunnel destination address, when configuring the hub router. DMVPN enables spoke routers to have dynamic external interface IP addresses, and provides robust configuration that does not have to be redeployed to the device even if the external interface IP address changes. When the spoke comes online, it sends to the hub registration packets that contain the physical interface IP address of the spoke.

- **Dynamic tunnel creation for direct spoke-to-spoke communication**

NHRP enables spoke routers to dynamically learn the external interface IP address of the routers in the VPN network. Using NHRP, the hub maintains an NHRP database of the public interface addresses of all the spokes (the clients). Each spoke registers its real address with the hub when it boots.

When a spoke wants to transmit a packet to another spoke, it can use NHRP to dynamically determine the required destination address of the destination spoke. The hub acts as the NHRP server, handling the request for the source spoke. This enables the dynamic creation of an IPsec+GRE tunnel directly between spoke routers, without having to go through a hub router, thus reducing the delay of multiple encryption and decryption actions on the hub.

## Configuring DMVPN

To configure a hub-and-spoke Dynamic Multipoint VPN, use the Create VPN wizard as described in [Creating or Editing VPN Topologies, page 24-28](#). You can also edit the membership of the VPN, or some of its policies, using the described procedures. If you are creating a Large Scale DMVPN, also see [Configuring Large Scale DMVPNs, page 26-16](#).

If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPsec settings, select **VPN Global Settings**. See [Configuring VPN Global Settings, page 25-29](#).
- For IKE proposal policies, select **IKE Proposal**. See [Configuring an IKE Proposal, page 25-9](#).
- For IPsec proposals, select **IPsec Proposal**. See [Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21](#).
- For preshared key policies, select **IKEv1 Preshared Key**. See [Configuring IKEv1 Preshared Key Policies, page 25-44](#).
- For public key (PKI) policies, select **Public Key Infrastructure**. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50](#).
- For Generic Routing Encapsulation configuration, including the selection of phase 2 or 3 connections between spokes, select **GRE Modes**. See [Configuring GRE Modes for DMVPN, page 26-12](#).
- For server load balancing policies that are used with Large Scale DMVPN, select **Server Load Balance**. See [Configuring Server Load Balancing in Large Scale DMVPN, page 26-17](#).

## Configuring GRE Modes for DMVPN

Use the GRE Modes policy to define the routing and tunnel parameters for IPsec tunneling in a DMVPN.

To open the GRE Modes policy:

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select a DMVPN or Large Scale DMVPN topology, then select **GRE Modes** from the policies list.
- (Policy view) Select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy. Then, select either DMVPN or Large Scale DMVPN from the **GRE Method** list.

The following table describes the elements on the GRE Modes page for configuring a DMVPN.

### Note

When configuring a DMVPN routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

Table 26-2 GRE Modes Page for DMVPN

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing Parameters Tab</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Routing Protocol                | <p>Select the required dynamic routing protocol, or static route, to be used in the DMVPN tunnel.</p> <p>Options include the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes. On-Demand Routing (ODR) is also supported. On-Demand Routing is not a routing protocol. It can be used in a hub-and-spoke VPN topology when the spoke routers connect to no other router other than the hub. If you are running dynamic protocols, On-Demand Routing is not suitable for your network environment.</p> <p>For more information, see <a href="#">Understanding GRE, page 26-2</a>.</p> |
| AS Number<br>(EIGRP only.)      | <p>The number that is used to identify the autonomous system (AS) area to which the EIGRP packet belongs. The range is 1-65535. The default is 110.</p> <p>An autonomous system (AS) is a collection of networks that share a common routing strategy. An AS can be divided into a number of areas, which are groups of contiguous networks and attached hosts. Routers with multiple interfaces can participate in multiple areas. An AS ID identifies the area to which the packet belongs. All EIGRP packets are associated with a single area, so all devices must have the same AS number.</p>         |
| Hello Interval<br>(EIGRP only.) | The interval between hello packets sent on the interface, from 1 to 65535 seconds. The default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Hold Time<br>(EIGRP only.)      | The number of seconds the router will wait to receive a hello message before invalidating the connection. The range is 1-65535. The default hold time is 15 seconds (three times the hello interval)                                                                                                                                                                                                                                                                                                                                                                                                        |
| Delay<br>(EIGRP only.)          | The throughput delay for the primary route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Bandwidth<br>(EIGRP only.)      | The bandwidth for the primary route interface, in kilobits. The range of bandwidth is 1 to 10000000. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Bandwidth<br>(EIGRP only.)      | <p>The amount of bandwidth available to the primary route interface for the EIGRP packets. You should enter a value that gives priority to the primary route over other routes.</p> <p>You can enter a value in the range 1 to 10000000 kb. The default is 1000 kb.</p> <p><b>Note</b> By default, the cost of sending a packet on an interface is calculated based on the bandwidth—the higher the bandwidth, the lower the cost.</p>                                                                                                                                                                      |
| Process Number<br>(OSPF only.)  | <p>The routing process ID number that will be used to identify the secured IGP that Security Manager adds when configuring DMVPN.</p> <p>The valid range for either protocol is 1-65535. The default is 110.</p>                                                                                                                                                                                                                                                                                                                                                                                            |

Table 26-2 GRE Modes Page for DMVPN (Continued)

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hub Network Area ID<br>(OSPF only.)             | The ID number of the area in which the hub's protected networks will be advertised, including the tunnel subnet. You can enter any number. The default is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Spoke Protected Network Area ID<br>(OSPF only.) | The ID number of the area in which the remote protected networks will be advertised, including the tunnel subnet. You can enter any number. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Authentication Key<br>(OSPF and RIPv2.)         | A string that indicates the OSPF or RIPv2 authentication key. The string can be up to eight characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Cost<br>(OSPF and RIPv2.)                       | The cost of sending a packet on the primary route interface.<br>If the selected protocol is OSPF, enter a value in the range 1-65535; the default is 100.<br>If the selected protocol is RIPv2, enter a value in the range 1-15; the default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Allow Direct Spoke to Spoke Connectivity        | Whether to enable direct communication between spokes without going through the hub. Select the DMVPN phase you want to use, which determines the types of connections that spokes can make: <ul style="list-style-type: none"> <li>• <b>Phase 2</b>—Spoke to spoke connections go through regional hubs and routing protocol updates from hubs to spokes are not summarized.</li> <li>• <b>Phase 3 (Default)</b>—Spokes can create direct connections with each other and routing updates from hubs to spokes are summarized. This option allows the greatest scalability and reduces latency. Devices must run IOS Software release 12.4(6)T or higher; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or higher. Security Manager automatically creates a phase 2 configuration for devices running a lower OS version.</li> </ul> For detailed information on how phase 2 and 3 differ, see <a href="#">“Migrating from Dynamic Multipoint VPN Phase 2 to Phase 3”</a> on Cisco.com.<br><b>Note</b> With direct spoke-to-spoke communication, you must use the Main Mode Address option for preshared key negotiation. For more information, see <a href="#">Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs</a> , page 25-43. |
| Filter Dynamic Updates On Spokes                | Unavailable if you are using On-Demand Routing or a static route for your DMVPN tunnel.<br>When selected, enables the creation of a redistribution list that filters all dynamic routing updates (EIGRP, OSPF, and RIPv2) on spokes. This forces the spoke devices to advertise (populate on the hub device) only their own protected subnets and not other IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Tunnel Parameters Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Tunnel IP Range              | <p>The IP address range of the inside tunnel interface IP address, including the unique subnet mask. This field defines a subnet, such as 10.1.1.0/24.</p> <p><b>Note</b> If Security Manager detects that a tunnel interface IP address already exists on the device, and its IP address matches the tunnel's IP subnet field, it will use that interface as the GRE tunnel.</p>                                                                                                                                                                                                                                                 |
| Dial Backup Tunnel IP Range  | If you are configuring a dial backup interface, enter its inside tunnel interface IP address range, including the unique subnet mask. This field defines a subnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Server Load Balance          | <p>When selected, enables the configuration of load balancing on a Cisco IOS router that serves as a hub in a multiple hubs configuration.</p> <p>Server load balancing optimizes performance in a multiple hubs configuration, by sharing the workload. In this configuration, the DMVPN server hubs share the same tunnel IP and source IP addresses, presenting the appearance of a single device to the spokes in a VPN topology.</p>                                                                                                                                                                                         |
| Enable IP Multicast          | <p>When selected, enables multicast transmissions across your GRE tunnels.</p> <p>IP multicast delivers application source traffic to multiple receivers without burdening the source or the receivers, while using a minimum of network bandwidth.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| Rendezvous Point             | <p>Only available if you selected the Enable IP Multicast check box.</p> <p>If required, you can enter the IP address of the interface that will serve as the rendezvous point (RP) for multicast transmission. Sources send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree.</p>                                                                                                                                                                                                                                                                                            |
| Tunnel Key                   | <p>A number that identifies the tunnel key. The default is 1.</p> <p>The tunnel key differentiates between different multipoint GRE (mGRE) tunnel Non Broadcast Multiple Access (NBMA) networks. All mGRE interfaces in the same NBMA network must use the same tunnel key value. If there are two mGRE interfaces on the same router, they must have different tunnel key values.</p> <p><b>Note</b> To view the newly created tunnel interfaces in the Router Interfaces page for routers that are members of the VPN, you must rediscover the device inventory details after successfully deploying the VPN to the device.</p> |
| <b>NHRP Parameters</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Network ID                   | All Next Hop Resolution Protocol (NHRP) stations within one logical Non-Broadcast Multi-Access (NBMA) network must be configured with the same network identifier. Enter a globally unique, 32-bit network identifier within the range of 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                        |

Table 26-2 GRE Modes Page for DMVPN (Continued)

| Element        | Description                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold time      | The time, in seconds, that routers will keep information provided in authoritative NHRP responses. The cached IP-to-NBMA address mapping entries are discarded after the hold time expires.<br><br>The default is 300 seconds.                             |
| Authentication | An authentication string that controls whether the source and destination NHRP stations allow intercommunication. All routers within the same network using NHRP must share the same authentication string. The string can be up to eight characters long. |

## Configuring Large Scale DMVPNs

You can configure DMVPN for large scale deployments that might comprise thousands of spokes. In large scale DMVPN topologies, IPsec Terminators, also referred to as Server Load Balance (SLB) devices, reside between the spokes and the hubs. The hubs must be directly connected to the IPsec Terminator—there can be no other device between them.

The IPsec Terminator, which is a Catalyst 6500/7600 device, performs encryption and decryption while the hubs handle all tasks related to Next Hop Resolution Protocol (NHRP) and multipoint generic routing encapsulation (mGRE). The IPsec Terminator is configured to specifically load balance GRE traffic to the hubs, and is configured with dynamic crypto to accept any spokes with any proxies. When using tunnel protection on spokes, these proxies are automatically set to match GRE traffic. One GRE tunnel is configured on the spokes. All hubs connecting to the same IPsec Terminator will use the same Tunnel IP address, and the tunnel source is the Virtual IP address of the IPsec Terminator.

In Security Manager, you configure a Large Scale DMVPN during the creation of a new hub-and-spoke VPN topology as described in [Creating or Editing VPN Topologies, page 24-28](#). You cannot edit an existing standard DMVPN and convert it to a Large Scale DMVPN. When you create the Large Scale DMVPN, keep the following points in mind:

- When you define the technology of the VPN, select **DMVPN** as the technology, and **Large Scale with IPsec Terminator** as the type. For the procedure, see [Defining the Name and IPsec Technology of a VPN Topology, page 24-30](#).
- When you select the devices for the VPN, select the required IPsec Terminators (Catalyst 6500/7600 devices), the hubs and all the spokes. For the procedure, see [Selecting Devices for Your VPN Topology, page 24-32](#).

There must be direct connectivity between the IPsec Terminators and the hubs.

- When you configure the endpoints, as described [Defining the Endpoints and Protected Networks, page 24-33](#), configure the following in the Edit Endpoints dialog box:
  - For each hub device, in the Hub Interface tab, select the interface that is connected to the IPsec Terminator. Each hub can be connected to only one IPsec Terminator. Also, identify the protected networks. Each hub in the Large Scale DMVPN must identify itself and its protected networks.
  - For each IPsec Terminator in the Large Scale DMVPN, specify a VPN external interface, the crypto engine slot, and the Inside VLAN. No protected networks are configured on an IPsec Terminator.

After you create the Large Scale DMVPN topology, a Server Load Balance policy is configured on the IPsec Terminators with all the required parameters, which you can edit if required. Initially, all hubs are given the same priority and number of VPN connections. For information on configuring the Server Load Balance policy, see [Configuring Server Load Balancing in Large Scale DMVPN, page 26-17](#).

**Note**

VRF-Aware IPsec cannot be configured in a Large Scale DMVPN.

## Configuring Server Load Balancing in Large Scale DMVPN

Use the Server Load Balance page to view or edit the server load balance policy configured on the IPsec Terminators in a large scale DMVPN. Server load balancing optimizes performance in multiple hub-and-spoke VPN topologies by sharing the workload among a group of hubs. In large scale DMVPN configurations, the IPsec Terminators perform the traffic load balancing. For more information, see [Configuring Large Scale DMVPNs, page 26-16](#).

A weighted round robin (WRR) scheduling algorithm is used to control the bandwidth allocated to output transmission queues. Weighting is based on the amount of bandwidth used by each transmit queue on an interface. Packets from queues with higher capacity are transmitted more often than those from queues with less capacity.

To open the Server Load Balance policy, in the [Site-to-Site VPN Manager Window](#), select an existing Large Scale DMVPN topology, then select **Server Load Balance** from the Policies list.

The table displays the hubs in the VPN, the hub's weight relative to other hubs connected to the same IPsec Terminator, and the maximum number of active connections allowed for the hub. To change the weight or maximum connections, select the hub and click the Edit (pencil) button beneath the table to open the [Edit Load Balancing Parameters Dialog Box, page 26-17](#).

# CHAPTER 27

## Easy VPN

---

Easy VPN is a hub-and-spoke VPN topology that can be used with a variety of routers, PIX, and ASA devices. Policies are defined mostly on the hub and pushed to remote spoke VPN devices, ensuring that clients have up-to-date policies in place before establishing a secure connection.

This chapter contains the following topics:

- [Understanding Easy VPN, page 27-1](#)
- [Configuring Client Connection Characteristics for Easy VPN, page 27-7](#)
- [Configuring an IPsec Proposal for Easy VPN, page 27-10](#)
- [Configuring a Connection Profile Policy for Easy VPN, page 27-13](#)
- [Configuring a User Group Policy for Easy VPN, page 27-14](#)

## Understanding Easy VPN

Easy VPN simplifies VPN deployment for remote offices. With Easy VPN, security policies defined at the head end are pushed to remote VPN devices, ensuring that clients have up-to-date policies in place before establishing a secure connection.

Security Manager supports the configuration of Easy VPN policies on hub-and-spoke VPN topologies. In such a configuration, most VPN parameters are defined on the Easy VPN server, which acts as the hub device. The centrally managed IPsec policies are pushed to the Easy VPN client devices by the server, minimizing the remote (spoke) devices configuration.

The Easy VPN Server can be a Cisco IOS router, a PIX Firewall, or an ASA 5500 series device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running ASA Software release 7.2 or later.

### Note

---

Some of the policies used in Easy VPN topologies are similar to those used in remote access VPNs. In remote access VPNs, policies are configured between servers and mobile remote PCs running VPN client software, whereas, in site-to-site Easy VPN topologies, the clients are hardware devices.

---

This section contains the following topics:

- [Easy VPN with Dial Backup, page 27-2](#)
- [Easy VPN with High Availability, page 27-2](#)
- [Easy VPN with Dynamic Virtual Tunnel Interfaces, page 27-2](#)

- [Easy VPN Configuration Modes, page 27-3](#)
- [Easy VPN and IKE Extended Authentication \(Xauth\), page 27-4](#)
- [Overview of Configuring Easy VPN, page 27-5](#)
- [Important Notes About Easy VPN Configuration, page 27-6](#)

## Easy VPN with Dial Backup

Dial backup for Easy VPN allows you to configure a dial backup tunnel connection on your remote client device. The backup feature is activated only when real traffic is ready to be sent, eliminating the need for expensive dialup or ISDN links that must be created and maintained even when there is no traffic.

**Note**

---

Easy VPN dial backup can be configured only on remote clients that are routers running IOS version 12.3(14)T or later.

---

In an Easy VPN configuration, when a remote device attempts to connect to the server and the tracked IP is no longer accessible, the primary connection is torn down and a new connection is established over the Easy VPN backup tunnel to the server. If the primary hub cannot be reached, the primary configuration switches to the failover hub with the same primary configuration and not to the backup configuration.

Only one backup configuration is supported for each primary Easy VPN configuration. Each inside interface must specify the primary and backup Easy VPN configuration. IP static route tracking must be configured for dial backup to work on an Easy VPN remote device. The object tracking configuration is independent of the Easy VPN remote dial backup configuration. The object tracking details are specified in the spoke's Edit Endpoints dialog box.

For more information about dial backup, see [Configuring Dial Backup, page 24-39](#).

## Easy VPN with High Availability

You can configure High Availability (HA) on devices in an Easy VPN topology. High Availability provides automatic device backup when configured on Cisco IOS routers or Catalyst 6500/7600 devices that run IP over LANs. You can create an HA group made up of two or more hub devices in your Easy VPN that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see [Configuring High Availability in Your VPN Topology, page 24-49](#).

## Easy VPN with Dynamic Virtual Tunnel Interfaces

The IPsec virtual tunnel interface (VTI) feature simplifies the configuration of GRE tunnels that need to be protected by IPsec for remote access links. A VTI is an interface that supports IPsec tunneling, and allows you to apply interface commands directly to the IPsec tunnels. The configuration of a virtual tunnel interface reduces overhead as it does not require a static mapping of IPsec sessions to a particular physical interface where the crypto map is applied.

IPsec VTIs support both unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Dynamic or static IP routing can be used to route the traffic to the virtual interface. Using IP routing to forward traffic to the tunnel interface simplifies IPsec

VPN configuration compared to the more complex process of using access control lists (ACLs) with a crypto map. Dynamic VTIs function like any other real interface so that you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

Dynamic VTIs use a virtual template infrastructure for dynamic instantiation and management of IPsec interfaces. In an Easy VPN topology, Security Manager implicitly creates the virtual template interface for the device. If the device is a hub, the user must provide the IP address on the hub that will be used as the virtual template interface—this can be a subnet (pool of addresses) or an existing loopback or physical interface. On a spoke, the virtual template interface is created without an IP address.

In Security Manager, you configure Dynamic VTI in the Easy VPN IPsec Proposal page. See [Configuring Dynamic VTI for Easy VPN, page 27-12](#).

#### Notes

- Dynamic VTI can be configured only in a hub-and-spoke Easy VPN topology on routers running IOS version 12.4(2)T and later, except 7600 devices. It is not supported on PIX Firewalls, ASA devices, or Catalyst 6000 series switches.
- Not all the hubs/spokes require Dynamic VTI configuration during discovery or provision. You can extend the existing Easy VPN topology (including routers not supporting dVTI) to add routers that support dVTI.
- Dynamic VTI is supported on only servers, only clients (if server does not support dVTI), or both clients and servers.
- You cannot configure High Availability on hubs/servers that have been configured with dVTI.
- You can also configure Dynamic VTI in remote access VPNs. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\), page 32-7](#).

## Easy VPN Configuration Modes

Easy VPN can be configured in three modes—Client, Network Extension, and Network Extension Plus.

- Client mode—The default configuration that allows devices at the client site to access resources at the central site, but disallows access to the central site for resources at the client site. In client mode, a single IP address is pushed to the remote client from the server when the VPN connection is established. This address is typically a routable address in the private address space of the customer network. All traffic passing across the Easy VPN tunnel undergoes Port Address Translation (PAT) to that single pushed IP address.
- Network Extension mode—Allows users at the central site to access the network resources at the client site, and allows the client PCs and hosts direct access to the PCs and hosts at the central site. Network Extension mode specifies that the hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by the destination network. The devices at both ends of the connection will form one logical network. PAT is not used, so the hosts at the client end have direct access to the hosts at the destination network. In other words, the Easy VPN server (the hub) gives routable addresses to the Easy VPN client (the spoke), while the whole LAN behind the client will not undergo PAT.
- Network Extension Plus mode—An enhancement to Network Extension mode, which can be configured only on IOS routers. It enables an IP address that is received via mode configuration to be automatically assigned to an available loopback interface. This IP address can be used for connecting to your router for remote management and troubleshooting (ping, Telnet, and Secure Shell). If you select this option on some clients are not IOS routers, those clients are configured in Network Extension mode.

**Note**

---

All modes of operation can also support split tunneling, which allows secure access to corporate resources through the VPN tunnel while also allowing Internet access through a connection to an ISP or other service (thereby eliminating the corporate network from the path for web access).

---

You configure the mode in the Client Connection Characteristics policy as described in [Configuring Client Connection Characteristics for Easy VPN, page 27-7](#).

## Easy VPN and IKE Extended Authentication (Xauth)

When negotiating tunnel parameters for establishing IPsec tunnels in an Easy VPN configuration, IKE Extended Authentication (Xauth) adds another level of authentication that identifies the user who requests the IPsec connection. If the VPN server is configured for Xauth, the client waits for a username/password challenge after the IKE security association (SA) has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication.

The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, a user-specific attribute can be retrieved if the credentials of that user are validated via RADIUS.

**Note**

---

VPN servers that are configured to handle remote clients should always be configured to enforce user authentication.

---

Security Manager allows you to save the Xauth username and password on the device itself so you do not need to enter these credentials manually each time the Easy VPN tunnel is established. The information is saved in the device's configuration file and used each time the tunnel is established. Saving the credentials in the device's configuration file is typically used if the device is shared between several PCs and you want to keep the VPN tunnel up all the time, or if you want the device to automatically bring up the tunnel whenever there is traffic to be sent.

Saving the credentials in the device's configuration file, however, could create a security risk, because anyone who has access to the device configuration can obtain this information. An alternative method for Xauth authentication is to manually enter the username and password each time Xauth is requested. You can select whether to use a web browser window or the router console to enter the credentials. Using web-based interaction, a login page is returned, in which you can enter the credentials to authenticate the VPN tunnel. After the VPN tunnel comes up, all users behind this remote site can access the corporate LAN without being prompted again for the username and password. Alternatively, you can choose to bypass the VPN tunnel and connect only to the Internet, in which case a password is not required.

**Easy VPN Tunnel Activation**

If the device credentials (Xauth username and password) are stored on the device itself, you must select a tunnel activation method for IOS router clients. Two options are available:

- **Auto**—The Easy VPN tunnel is established automatically when the Easy VPN configuration is delivered to the device configuration file. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely. This is the default option.
- **Traffic Triggered Activation**—The Easy VPN tunnel is established whenever outbound local (LAN side) traffic is detected. Traffic Triggered Activation is recommended for use with the Easy VPN dial backup configuration so that backup is activated only when there is traffic to send across the tunnel. When using this option, you must specify the Access Control List (ACL) that defines the “interesting” traffic.

**Note**

Manual tunnel activation is configured implicitly if you select to configure the Xauth password interactively. In this case, the device waits for a command before attempting to establish the Easy VPN remote connection. When the tunnel times out or fails, subsequent connections will also have to wait for the command.

You configure the xauth and tunnel activation mode in the Client Connection Characteristics policy as described in [Configuring Client Connection Characteristics for Easy VPN, page 27-7](#).

## Overview of Configuring Easy VPN

When a remote client initiates a connection to a VPN server, device authentication between the peers occurs using IKE, followed by user authentication using IKE Extended Authentication (Xauth), VPN policy push (in Client, Network Extension, or Network Extension Plus mode), and IPsec security association (SA) creation.

The following provides an overview of this process:

1. The client initiates IKE Phase 1 via aggressive mode if a preshared key is to be used for authentication, or main mode if digital certificates are used. If the client identifies itself with a preshared key, the accompanying user group name (defined during configuration) is used to identify the group profile associated with this client. If digital certificates are used, the organizational unit (OU) field of a distinguished name (DN) is used to identify the user group name. See [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 25-61](#).

**Note**

Because the client may be configured for preshared key authentication, which initiates IKE aggressive mode, the administrator should change the identity of the VPN device via the `crypto isakmp identity hostname` command. This will not affect certificate authentication via IKE main mode.

2. The client attempts to establish an IKE SA between its public IP address and the public IP address of the VPN server. To reduce the amount of manual configuration on the client, every combination of encryption and hash algorithms, in addition to authentication methods and D-H group sizes, is proposed.
3. Depending on its IKE policy configuration, the VPN server determines which proposal is acceptable to continue negotiating Phase 1.

---

**Note** Device authentication ends and user authentication begins at this point.

---

- After the IKE SA is successfully established, and if the VPN server is configured for Xauth, the client waits for a “username/password” challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, a user-specific attribute can be retrieved if the credentials of that user are validated via RADIUS.

---

**Note** VPN servers that are configured to handle remote clients should always be configured to enforce user authentication.

---

- If the server indicates that authentication was successful, the client requests further configuration parameters from the peer. The remaining system parameters (for example, IP address, DNS, and split tunnel attributes) are pushed to the client using client or network extension mode configuration.

---

**Note** The IP address pool and group preshared key (if Rivest, Shamir, and Adelman [RSA] signatures are not being used) are the only required parameter in a group profile. All other parameters are optional.

---

- After each client is assigned an internal IP address via mode configuration, Reverse Route Injection (RRI), if configured, ensures that a static route is created on the device for each client internal IP address.
- IKE quick mode is initiated to negotiate and create IPsec SAs.

The connection is complete.

## Important Notes About Easy VPN Configuration

Before you configure an Easy VPN policy in your topology, you should know the following:

- In an Easy VPN topology configuration, deployment fails if a 72xx series router is used as a remote client device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running ASA Software release 7.2 or later.
- If you try to configure a Public Key Infrastructure (PKI) policy on a PIX 6.3 remote client in an Easy VPN topology configuration, deployment fails. For successful deployment on this device, you must first issue the PKI certificate on the CA server, and then try again to deploy the device. For more information about PKI policies, see [Understanding Public Key Infrastructure Policies, page 25-47](#).
- In some cases, deployment fails on a device that serves as an Easy VPN client if the crypto map is configured on the NAT (or PAT) internal interface instead of the external interface. On some platforms, the inside and outside interfaces are fixed. For example, on a Cisco 1700 series router the VPN interface must be the device’s FastEthernet0 interface. On a Cisco 800 series router the VPN interface could be either the device’s Ethernet0 or Dialer1 interface, depending on the configuration. On a Cisco uBR905/uBR925 cable access router, the VPN interface must be the Ethernet0 interface.

# Configuring Client Connection Characteristics for Easy VPN

Use the Client Connection Characteristics page to specify how traffic will be routed in the Easy VPN topology and how the VPN tunnel will be established. The characteristics defined in this policy are configured on the remote clients. Before configuring this policy, read the following topics:

- [Easy VPN Configuration Modes, page 27-3](#)
- [Easy VPN and IKE Extended Authentication \(Xauth\), page 27-4](#)

## Navigation Path

- (Site-to-Site VPN Manager Window, page 24-18) Select an Easy VPN topology in the VPNs selector, then select **Client Connection Characteristics** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Client Connection Characteristics** and create a new policy or edit an existing policy.

## Related Topics

- [Understanding Easy VPN, page 27-1](#)
- [Creating Access Control List Objects, page 6-49](#)
- [Important Notes About Easy VPN Configuration, page 27-6](#)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode    | <p>The configuration mode for the remote devices:</p> <ul style="list-style-type: none"> <li>• <b>Client</b>—Specifies that all traffic from the remote client's inside network will undergo Port Address Translation (PAT) to a single IP address which was assigned for the device by the head end server at connect time.</li> <li>• <b>Network Extension</b>—Specifies that PCs and other hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by destination network. PAT is not used, allowing the client PCs and hosts to have direct access to the PCs and hosts at the destination network.</li> <li>• <b>Network Extension Plus</b>—An enhancement to Network Extension mode, that enables an IP address that is received via mode configuration to be automatically assigned to an available loopback interface. The IPsec SAs for this IP address are automatically created by the Easy VPN client. The IP address is typically used for troubleshooting (using ping, Telnet, and Secure Shell).</li> </ul> <p>If you select Network Extension Plus, this mode is configured on IOS routers only. Clients that are PIX or ASA devices are configured in Network Extension mode.</p> <p>For more information, see <a href="#">Easy VPN Configuration Modes, page 27-3</a>.</p> |

Table 27-1 Easy VPN Client Connection Characteristics Page (Continued)

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Xauth Credentials Source | <p>Select how you want to enter the Xauth credentials for user authentication when you establish a VPN connection with the server:</p> <ul style="list-style-type: none"> <li>• <b>Device Stored Credentials (default)</b>—The username and password are saved on the device itself in the device’s configuration file to be used each time the tunnel is established.</li> <li>• <b>Interactive Entered Credentials</b>—Enables you to manually enter the username and password each time Xauth is requested, in a web browser window or from the router console.</li> </ul> <p>For more information, see <a href="#">Easy VPN and IKE Extended Authentication (Xauth)</a>, page 27-4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Xauth Credentials        | <p>Available only if you selected <b>Device Stored Credentials</b> as the Xauth Credentials Source.</p> <p>The credentials policy object that defines the default Xauth credentials. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Configuring Credentials Policy Objects</a>, page 27-9.</p> <p><b>Note</b> If you want to configure different Xauth credentials on your remote client, you must configure the credentials policy object to allow overrides (select <b>Allow Value Override per Device</b> in the object definition).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Tunnel Activation (IOS)  | <p>Available only if you selected the <b>Device Stored Credentials</b> option for the Xauth password source.</p> <p>For IOS router clients, select a tunnel activation method:</p> <ul style="list-style-type: none"> <li>• <b>Auto (default)</b>—The Easy VPN tunnel is established automatically when the Easy VPN configuration is delivered to the device configuration file. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely.</li> <li>• <b>Traffic Triggered Activation</b>—The Easy VPN tunnel is established whenever outbound local (LAN side) traffic is detected. If you select traffic triggered activation, also enter the name of the Access Control List (ACL) policy object that defines the traffic that should activate the tunnel. Click <b>Select</b> to select the object or to create a new object.</li> </ul> <p>Traffic Triggered Activation is recommended for use when Easy VPN dial backup is configured so that backup is activated only when there is traffic to send across the tunnel.</p> <p><b>Note</b> Manual tunnel activation is configured implicitly when you select to configure the Xauth password interactively.</p> |

**Table 27-1** Easy VPN Client Connection Characteristics Page (Continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Authentication Method (IOS) | <p>Available only if you selected the <b>Interactive Entered Credentials</b> option for the Xauth credentials source. The option applies to remote IOS routers only.</p> <p>Select one of these ways to enter the Xauth username and password interactively each time Xauth authentication is requested:</p> <ul style="list-style-type: none"> <li>• Web Browser (default)—Manually in a web browser window.</li> <li>• Router Console—Manually from the router’s command line.</li> </ul> |

## Configuring Credentials Policy Objects

Use the Credentials dialog box to create, copy and edit Credential objects.

Credential objects are used in Easy VPN configuration during IKE Extended Authentication (Xauth) when authenticating user access to the network and network services. When negotiating tunnel parameters for establishing IPsec tunnels in an Easy VPN configuration, Xauth identifies the user who requests the IPsec connection. If the VPN server is configured for Xauth, the client waits for a “username/password” challenge after the IKE SA has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication. You can save the Xauth credentials (username and password) on the device itself so you do not need to enter them manually each time the Easy VPN tunnel is established.

### Navigation Path

Select **Manage > Policy Objects**, then select **Credentials** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Element                                   | Description                                                                                                                                                                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                              |
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> . |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring an IPsec Proposal for Easy VPN

Use the Easy VPN IPsec Proposal page to configure the IPsec proposal used during IKE Phase 2 negotiations for Easy VPN topologies. The IPsec proposal is configured on the IPsec Proposal tab; the options are described below.

In Easy VPN topologies, you can also configure a dynamic virtual interface on the Dynamic VTI tab. For an explanation of dVTI configuration, see [Configuring Dynamic VTI for Easy VPN, page 27-12](#).

### Note

This topic describes the IPsec Proposal page when the site-to-site VPN technology is Easy VPN. For a description of the IPsec Proposal page when the site-to-site VPN technology is something else, see [Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21](#).

### Navigation Path

- (Site-to-Site VPN Manager Window, page 24-18) Select an Easy VPN topology in the VPNs selector, then select **Easy VPN IPsec Proposal** in the Policies selector. Click the **IPsec Proposal** tab.
- (Policy view) Select **Site-to-Site VPN > Easy VPN IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one. Click the **IPsec Proposal** tab.

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKEv1 Transform Sets                         | <p>The transform sets to be used for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. You can select up to 11 transform sets. For more information, see <a href="#">Understanding Transform Sets, page 25-19</a>.</p> <p>Transform sets may use only tunnel mode IPsec operation.</p> <p>If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used.</p> <p>Click <b>Select</b> to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 25-25</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Reverse Route                                | <p>Supported on ASA 5500 series devices, PIX 7.0+ devices, and Cisco IOS routers except 7600 devices.</p> <p>Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. For more information, see <a href="#">Understanding Reverse Route Injection, page 25-20</a>.</p> <p>Select one of the following options to configure RRI on the crypto map:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—Disables the configuration of RRI on the crypto map.</li> <li>• <b>Standard</b>—(ASA, PIX 7.0+, IOS devices) Creates routes based on the destination information defined in the crypto map access control list (ACL). This is the default option.</li> <li>• <b>Remote Peer</b>—(IOS devices only) Creates two routes, one for the remote endpoint and one for route recursion to the remote endpoint via the interface to which the crypto map is applied.</li> <li>• <b>Remote Peer IP</b>—(IOS devices only) Specifies an address as the explicit next hop to the remote VPN device. Enter the IP address or a network/host object that specifies the address, or click <b>Select</b> to select the network/host object from a list or to create a new object.</li> </ul> <p><b>Note</b> If you use network/host objects, you can select the <b>Allow Value Override per Device</b> option in the object to override the IP address, if required, for specific devices that use this object.</p> |
| Enable Network Address Translation Traversal | <p>Supported on PIX 7.0+ and ASA 5500 series devices.</p> <p>Whether to allow Network Address Translation (NAT) traversal.</p> <p>Use NAT traversal when there is a device between a VPN-connected hub and spoke, and that performs Network Address Translation (NAT) on the IPsec traffic. For information about NAT traversal, see <a href="#">Understanding NAT in VPNs, page 25-37</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 27-3 Easy VPN IPsec Proposal Tab (Continued)

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Policy Lookup/AAA Authorization Method          | <p>Supported on Cisco IOS routers only.</p> <p>The AAA authorization method list that will be used to define the order in which the group policies are searched. Group policies can be configured on both the local server or on an external AAA server. Remote users are grouped, so that when the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p>                                                                                                                                                                                                                                                                                                                                                |
| User Authentication (Xauth)/AAA Authentication Method | <p>Supported on Cisco IOS routers and PIX 6.3 firewalls only.</p> <p>The AAA or Xauth user authentication method used to define the order in which user accounts are searched.</p> <p>Xauth allows all AAA authentication methods to perform user authentication in a separate phase after the IKE authentication phase 1 exchange. The AAA configuration list-name must match the Xauth configuration list-name for user authentication to occur.</p> <p>After the IKE SA is successfully established, and if the device is configured for Xauth, the client waits for a username/password challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p> |

## Configuring Dynamic VTI for Easy VPN

Use the Dynamic VTI tab of the Easy VPN IPsec Proposal policy to configure a dynamic virtual tunnel interface on a device in a hub-and-spoke Easy VPN topology. For more information, see [Easy VPN with Dynamic Virtual Tunnel Interfaces, page 27-2](#).

### Note

Dynamic VTI can be configured only on IOS routers running IOS version 12.4(2)T and later, except 7600 devices.

### Navigation Path

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select an Easy VPN topology in the VPNs selector, then select **Easy VPN IPsec Proposal** in the Policies selector. Click the **Dynamic VTI** tab.
- (Policy view) Select **Site-to-Site VPN > Easy VPN IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one. Click the **Dynamic VTI** tab.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Dynamic VTI  | <p>When selected, enables Security Manager to implicitly create a dynamic virtual template interface on the device.</p> <p>If the device is a hub server that does not support Dynamic VTI, a warning message is displayed, and a crypto map is deployed without dynamic VTI. In the case of a client device, an error message is displayed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Virtual Template IP | <p>If you are configuring Dynamic VTI on a hub in the topology, specify either the subnet address or interface role:</p> <ul style="list-style-type: none"> <li>• <b>Subnet</b>—To use the IP address taken from a pool of addresses. Enter the private IP address including the subnet mask, for example 10.1.1.0/24.</li> <li>• <b>Interface Role</b>—To use a physical or loopback interface on the device. If required, click <b>Select</b> to open the Interface selector where you can select the interface role object that identifies the desired interface. If an appropriate object does not already exist, you can create one in the selection dialog box.</li> </ul> <p>If you are configuring Dynamic VTI on a spoke in the topology, select <b>None</b>.</p> |

## Configuring a Connection Profile Policy for Easy VPN

A connection profile consists of a set of records that contain IPsec tunnel connection policies. Connection profiles, or tunnel groups, identify the group policy for a specific connection, and include user-oriented attributes. If you do not assign a particular group policy to a user, the default group policy for the connection applies. For a successful connection, the username of the remote client must exist in the database, otherwise the connection is denied.

In site-to-site VPNs, you configure connection profile policies on an Easy VPN server, which can be a PIX Firewall version 7.0+ or an ASA 5500 series device. The Easy VPN connection profile policy is similar to the one used for remote access VPNs. You can unassign the connection profile policy if none of the Easy VPN servers are ASA or PIX 7.0+ devices.

Creating a connection profile policy involves specifying:

- The group policy—A collection of user-oriented attributes stored either internally on the device or externally on RADIUS/LDAP server.
- Global AAA settings—Authentication, Authorization, and Accounting servers.
- The DHCP servers to be used for client address assignment, and the address pools from which the IP addresses will be assigned.
- Settings for Internet Key Exchange (IKE) and IPsec (such as preshared key).

On the PIX7.0+/ASA Connection Profiles page, you can connection profiles on your Easy VPN server.

- 
- Step 1** Do one of the following:
- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select an Easy VPN topology in the VPNs selector, then select **Connection Profiles (PIX 7.0/ASA)** in the Policies selector.
  - (Policy view) Select **Site-to-Site VPN > Connection Profiles (PIX 7.0/ASA)** from the Policy Types selector. Select an existing shared policy or create a new one.
- For information on the policy, see [Connection Profiles Page, page 30-8](#).
- Step 2** On the **General** tab, specify the connection profile name and group policies and select which method (or methods) of address assignment to use. For a description of the available properties, see [General Tab \(Connection Profiles\), page 30-9](#).
- Step 3** Click the **AAA** tab and specify the AAA authentication parameters for an the connection profile. For a description of the elements on the tab, see [AAA Tab \(Connection Profiles\), page 30-11](#).
- Step 4** Click the **IPsec** tab and specify IPsec and IKE parameters for the connection profile. For a description of the elements on the tab, see [IPSec Tab \(Connection Profiles\), page 30-16](#).
- 

## Configuring a User Group Policy for Easy VPN

Use the User Group Policy page to create or edit a user group policy on your Easy VPN server. When you configure an Easy VPN server, you create a user group to which remote clients belong. An Easy VPN user group policy can be configured on a Cisco IOS security router, PIX 6.3 Firewall, or Catalyst 6500 /7600 device. You can unassign the user group policy if none of the Easy VPN servers are IOS routers, Catalyst 6500/7600 devices, or PIX 6.3 firewalls.

Remote clients must have the same group name as the user group configured on the server in order to connect to the device, otherwise no connection is established. When the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.

Select the user group policy object that you want to use in the policy from the Available User Groups list. You can create a new user group object by clicking the **Create (+)** button, or edit an existing group by selecting it and clicking the **Edit (pencil icon)** button. For information about configuring the user group object, see [Add or Edit User Group Dialog Box, page 33-58](#).

#### Navigation Path

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select an Easy VPN topology in the VPNs selector, then select **User Group Policy** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > User Group Policy** from the Policy Types selector. Select an existing shared policy or create a new one.

## CHAPTER 28

# Group Encrypted Transport (GET) VPNs

---

Cisco Group Encrypted Transport virtual private network (GET VPN) is a full-mesh VPN technology that can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). GET VPN comprises a set of features that are necessary to secure IP multicast group traffic or unicast traffic over a private WAN that originates on or flows through a Cisco IOS device. GET VPN combines the keying protocol Group Domain of Interpretation (GDOI) with IP security (IPsec) encryption to provide users with an efficient method to secure IP multicast or unicast traffic. GET VPN enables the router to apply encryption to nontunneled (that is, “native”) IP multicast and unicast packets and eliminates the requirement to configure tunnels to protect multicast and unicast traffic.

Cisco Group Encrypted Transport VPN provides the following benefits:

- Provides data security and transport authentication, helping to meet security compliance and internal regulation by encrypting all WAN traffic.
- Enables high-scale network meshes and eliminates complex peer-to-peer key management with group encryption keys.
- For Multiprotocol Label Switching (MPLS) networks, maintains network intelligence such as full-mesh connectivity, natural routing path, and Quality of Service (QoS).
- Grants easy membership control with a centralized key server.
- Helps ensure low latency and jitter by enabling full-time, direct communications between sites, without requiring transport through a central hub.
- Reduces traffic loads on customer premises equipment (CPE) and provider-edge (PE) encryption devices by using the core network for replication of multicast traffic, avoiding packet replication at each individual peer site.

**Tip**

---

For information about the CLI configuration of GET VPN, see [Cisco Group Encrypted Transport VPN](#) on Cisco.com.

## Understanding Group Encrypted Transport (GET) VPNs

Networked applications such as voice and video increase the need for instantaneous, branch-interconnected, and QoS-enabled WANs. The distributed nature of these applications results in increased demands for scale. At the same time, enterprise WAN technologies force businesses to trade off between QoS-enabled branch interconnectivity and transport security. As network security risks increase and regulatory compliance becomes essential, Group Encrypted Transport VPN (GET VPN), a WAN encryption technology, eliminates the need to compromise between network intelligence and data privacy.

With GET, Cisco provides tunnelless VPN, which eliminates the need for IPsec tunnels. By removing the need for point-to-point tunnels, meshed networks can scale higher while maintaining network-intelligence features critical to voice and video quality. GET is a standards-based security model that is based on the concept of a trusted group to eliminate point-to-point IPsec tunnels and their associated overlay routing. Trusted group members share a common security association (SA), also known as a group SA. This enables group members to decrypt traffic that was encrypted by any other group member. By using trusted groups instead of point-to-point tunnels, full-mesh networks can scale higher while maintaining network-intelligence features (such as QoS, routing, and multicast), which are critical to voice and video quality.

GET-based networks can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). MPLS VPNs that use this encryption technology are highly scalable, manageable, and cost-effective, and they meet government-mandated encryption requirements. The flexible nature of GET allows security-conscious enterprises either to manage their own network security over a service provider WAN service or to offload encryption services to their providers. GET simplifies securing large Layer 2 or MPLS networks that require partial or full-mesh connectivity.

In addition to leveraging the existing IKE, IPsec and multicast technologies, a GET VPN topology includes these key elements and features:

- **Group members**—The routers that exchange the actual traffic within the VPN are called group members. Group members provide encryption services to the traffic. Encryption policies are defined centrally on the key server and downloaded to the group member at the time of registration. Based on these downloaded policies, a group member decides whether traffic needs to be encrypted or decrypted and what keys to use.

Although group members primarily obtain encryption policies from the key server, you can configure local service policy ACLs on the group members to exclude traffic from encryption based on local requirements. For more information, see [Understanding the GET VPN Security Policy and Security Associations, page 28-10](#).

---

**Note** A device can be a group member of more than one group.

---

- **Key servers**—The routers that act as key servers are the gatekeepers to the topology. The group member must successfully register with a key server before becoming an active member of the VPN. The key servers control the shared service policy, and generate and transmit keys to group members. Key servers cannot be group members themselves, but a single key server can service more than one topology. For more information, see [Understanding the GET VPN Registration Process, page 28-4](#).
- **The Group Domain of Interpretation (GDOI) group key management protocol** is used to provide a set of cryptographic keys and policies to a group of devices. In a GET VPN network, GDOI is used to distribute common IPsec keys to a group of enterprise VPN gateways (group members) that must communicate securely. Devices designated as key servers periodically refresh and send out the updated keys to the group members using a process called “rekeying.”

The GDOI protocol uses the Phase 1 Internet Key Exchange (IKE) SA. All participating VPN gateways authenticate themselves to the device providing keys using IKE. All IKE authentication methods, for example, pre-shared keys (PSKs) and public key infrastructure (PKI), are supported for initial authentication. After the VPN gateways are authenticated and provided with the appropriate security keys using the IKE SA, the IKE SA expires and GDOI is used to update the group members in a more scalable and efficient manner. For more information about GDOI, refer to RFC 3547.

- **Address preservation**—IPsec-protected data packets carry the original source and destination in the outer IP header rather than replacing them with tunnel endpoint addresses. Address preservation allows GET VPN to use the routing functionality present within the core network. Address preservation allows routing to deliver the packets to any customer-edge (CE) device in the network that advertises a route to the destination address. Any source and destination matching the policy for the group will be treated in a similar manner. In the situation where a link between IPsec peers is not available, address preservation also helps combat traffic “black-hole” situations.

Header preservation also maintains routing continuity throughout the enterprise address space and in the WAN. As a result, end host addresses of the campus are exposed in the WAN (for MPLS, this applies to the edge of the WAN). For this reason, GET VPN is applicable only when the WAN network acts as a “private” network (for example, in an MPLS network).

The following figure shows the general operation of a GET VPN topology.

**Figure 28-1**      **General GET VPN Operation**

1. Group members register with the key server using the Group Domain of Interpretation (GDOI) protocol. The key server authenticates and authorizes the group members and downloads the IPsec policy and keys that are necessary for them to encrypt and decrypt IP multicast and unicast packets. The registration process can use unicast or multicast communications.

2. Group members exchange IP packets that are encrypted using IPsec. Only the group members are an active part of the VPN.
3. As needed, the key server pushes a rekey message to the group members. The rekey message contains new IPsec policy and keys to use when old IPsec security associations (SAs) expire. Rekey messages are sent in advance of the SA expiration time to ensure that valid group keys are always available.

GET VPN is provisioned using Security Manager with the following caveats:

- GET VPN-aware VRF is not supported.
- DMVPN with GET is not supported, because there is no way to define DMVPN without tunnel protection in Security Manager.
- Manual configuration of a group member to join a multicast group (ip igmp join-group) is not supported. Security Manager only provisions static source-specific multicast (SSM) mappings.

## Understanding the GET VPN Registration Process

In GET VPN, group members comprise the VPN topology. Traffic in the VPN is traffic between group members. For a device to become a group member, the device must successfully register with a key server. Key servers maintain the security association (SA) policy and create and maintain the keys for the group. When a group member registers, the key server downloads the policy and the keys to the group member. The key server also rekeys the group before existing keys expire.

The key server has two responsibilities: servicing registration requests and sending rekeys. A group member can register at any time and receive the most current policy and keys. When a group member registers with the key server, the key server verifies the group ID that the group member is attempting to join. If the group ID is valid, the key server sends the security association policy to the group member. After the group member acknowledges that it can handle the downloaded policy, the key server downloads the respective keys.

Communication among the key server and group members is encrypted and secured using two types of keys: the traffic encryption key (TEK) and the key encryption key (KEK). The TEK is downloaded by the key server to all the group members. The downloaded TEK is used by all the group members to communicate securely among each other. This key is essentially the group key that is shared by all the group members. The group policies and IPsec SAs are refreshed by the key server using periodic rekey messages to the group members. The KEK is also downloaded by the key server and is used by the group members to decrypt the incoming rekey messages from the key server.

The key server sends out rekey messages either because of an impending IPsec SA expiration or because the security policy has changed on the key server. A rekey can also happen if the KEK timer has expired (the key server sends out a KEK rekey). Rekey messages might also be retransmitted periodically to account for possible packet loss. If the rekey mechanism is multicast, there is no efficient feedback mechanism by which receivers can indicate that they did not receive a rekey message, so retransmission seeks to bring all receivers up to date. If the rekey mechanism is unicast, the receivers send an acknowledgment message.

The key server generates the group policy and IPsec security associations (SAs) for the GDOI group. The information generated by the key server includes multiple TEK attributes, traffic encryption policy, lifetime, source and destination, a Security Parameter Index (SPI) ID that is associated with each TEK, and the rekey policy (one KEK). Note that the group member might also have a local security policy configured that is merged with the one downloaded; for complete information see [Understanding the GET VPN Security Policy and Security Associations](#), page 28-10.

The following figure illustrates the communication flow between group members and the key server. The key server, after receiving registration messages from a group member, generates the information that contains the group policy and new IPsec SAs. The new IPsec SA is then downloaded to the group member. The key server maintains a table that contains the IP address of each group member per group. When a group member registers, the key server adds its IP address in its associated group table, thus allowing the key server to monitor an active group member. A key server can support multiple groups. A group member can be part of multiple groups.

**Figure 28-2** Communication Flow Between Group Members and the Key Server

When you configure the GET VPN topology, you can configure the following registration-related features:

- Decide whether to use unicast or multicast for group registration and rekeying. For more information, see [Choosing the Rekey Transport Mechanism](#), page 28-6.

**Note** If you use multicast, you need to enable multicast on the key servers and group members manually. Security Manager does not provision multicast commands.

- Decide whether to configure more than one key server to provide redundancy and load balancing. For more information, see [Configuring Redundancy Using Cooperative Key Servers](#), page 28-7.
- Decide whether to configure fail-close mode on group members to protect their traffic prior to successful registration with the key server. For more information, see [Configuring Fail-Close to Protect Registration Failures](#), page 28-8.

- Decide whether to require authorization for group members to join the group. You can use certificate authorization (which requires that you also configure the Public Key Infrastructure policy) or preshared keys. Configuring authorization is required if the key server serves more than one group. For information about the configuration options, see the Authorization Type setting described in [Defining GET VPN Group Encryption, page 24-51](#).

## Choosing the Rekey Transport Mechanism

When you configure the rekey settings in the Group Encryption Policy (as described in [Defining GET VPN Group Encryption, page 24-51](#)), you must select whether to use multicast or unicast as the rekey transport mechanism. The key server uses this method whenever sending new keys and IPsec security associations (SAs) to group members or each other. There are advantages and disadvantages to each method.

**Multicast** is the standard choice. Using multicast, the key server sends one copy of each rekey message to all group members at once using a multicast group address, so there is no rekey delay and group members can install the updated security policy essentially simultaneously (not accounting for regular network delay). However, in some networks, multicast is either an extra cost feature, or it is simply not allowed. If you configure multicast, you must supply the multicast address that will be used by the GET VPN topology.

**Unicast** can be used when multicast is unavailable or undesirable. Using unicast, the key server sends directed rekey and IPsec SAs to group members, and the group member sends an acknowledgment that the message was received. Because unicast requires sending direct messages and receiving acknowledgments, the key server sends the unicast messages to a subset of the group members at a time (unless you have a relatively small VPN, perhaps fewer than 30 group members, in which case all group members might be sent messages at the same time).

Thus, the relative benefits of multicast and unicast include the following:

- With multicast, the key server does not know if a group member receives a message, whereas with unicast, there are acknowledgments. With unicast, if the key server does not receive the acknowledgment, it resends the message.
- Multicast is faster than unicast, especially for large topologies with hundreds of group members. Multicast rekey uses the same low CPU overhead whether there is one group member in the group or a few thousand.
- With unicast, if a group member continuously fails to send acknowledgments, the key server decides the group member is no longer there and stops sending rekey messages. Thus, the key server always has a list of active group members. The unresponsive group member must reregister to rejoin the GET VPN topology. Because multicast does not use acknowledgments, the key server does not know if a group member becomes unresponsive, and it does not maintain a list of active group members.

#### Tip

To use multicast, you must enable multicast on the key servers and group members. Security Manager does not provision these commands; it only enables multicast rekey, it does not enable the router to send and receive multicast traffic. Therefore, you must manually enable multicast on the device, or use the FlexConfig policy to provision the commands (see [Creating FlexConfig Policy Objects, page 7-27](#)).

Fortunately, it is possible to mix multicast and unicast in a single GET VPN topology so long as all key servers support multicast. When deciding which transport mechanism to use, consider the following recommendations:

- If all key servers and group members, and the network, support multicast, use multicast.
- If all of the key servers and most of the group members support multicast, but a small number of group members do not support multicast, use multicast. Group members that do not support multicast will not receive rekey and IPsec SA updates. However, when the lifetime settings for these items are about to expire, unicast group members will reregister with the key server and obtain the new keys and IPsec SAs.
- If no group members, or only a few, support multicast, use unicast. The group members will then receive rekeys and IPsec SA updates from the key server and not need to reregister to get them.

- [Generating and Synchronizing RSA Keys, page 28-13](#)
- [Configuring GET VPN, page 28-12](#)

## Configuring Redundancy Using Cooperative Key Servers

The key server is the most important entity in the GET VPN network because the key server maintains the control plane. Therefore, a single key server is a single point of failure for an entire GET VPN network. Because redundancy is an important consideration for key servers, GET VPN supports multiple key servers, called cooperative (COOP) key servers, to ensure seamless fault recovery if a key server fails or becomes unreachable.

You can configure a group member to register to any available key server from a list of all COOP key servers. The group member configuration determines the registration order (see [Configuring GET VPN Group Members, page 28-20](#) and [Edit Group Member Dialog Box, page 28-21](#)). The key server defined first is contacted first, followed by the second defined key server, and so on. It is a best practice to distribute group member registration to all available COOP key servers to reduce the IKE processing load on a single key server. Note that only the primary key server sends rekey messages.

When COOP key servers boot, all key servers assume a *secondary* role and begin an election process. One key server, typically the one having the highest priority, is elected as a *primary* key server. The other key servers remain in the secondary state. The primary key server is responsible for creating and distributing group policies to all group members and to periodically synchronize the COOP key servers.

Cooperative key servers exchange one-way announcement messages (primary to secondary). If a secondary key server does not hear from the primary key server for a certain length of time, the secondary key server tries to contact the primary key server and request updated information. If the primary key server does not respond, or if the secondary key server does not hear from the primary key server, a COOP key server reelection is triggered and a new primary key server is elected.

Up to eight key servers can be defined as COOP key servers, but more than four COOP key servers are seldom required. Because rekey information is generated and distributed from a single primary key server, the advantage of deploying more than two key servers is the ability to handle registration load in case of a network failure and reregistration taking place at the same time. This is especially important when using Public Key Infrastructure (PKI) group member authorization because IKE negotiation using PKI requires a lot more CPU power compared to IKE negotiation using pre-shared keys (PSKs).

**Tips**

- The RSA key must be the same on all cooperative key servers. For information on synchronizing the RSA key, see [Generating and Synchronizing RSA Keys, page 28-13](#).
- It is a best practice to enable periodic ISAKMP keepalives between key servers so that the primary key server can track and display the state of the other secondary key servers. IKE Keepalives between group members and the key server is not required and is not supported. For information on configuring keepalives, see [Configuring Global Settings for GET VPN, page 28-16](#).
- The COOP protocol is configured on a per GDOI group basis. A key server that is configured with multiple GDOI groups can maintain multiple unique COOP relationships with disparate key servers.

## Configuring Fail-Close to Protect Registration Failures

Group members must register with the key server to become members of the GET VPN. Before a group member successfully registers with the key server, traffic passing through the group member's GET VPN interface is not encrypted. The period of time in which clear-text transmissions occur can be short (if registration succeeds) or potentially long, if the group member fails to register for any reason.

This default behavior is known as fail-open. If you consider it a violation of your security standards that traffic is sent in clear text at any time, you can configure fail-close mode to protect traffic before (or during) registration. With fail-close mode, all traffic on the interface is dropped except for the traffic you specifically identify in the fail-close ACL. Fail-close mode essentially shuts down the interface until the group member successfully registers with the key server and downloads the required keys and security policy and associations. Note that the use of fail-close mode requires as a minimum Cisco IOS Software release 12.4(22)T or 15.0; you can also configure it on all supported ASRs (see [Understanding Devices Supported by Each IPsec Technology, page 24-9](#)).

Fail-close mode is used only during the initial registration. If a group member has already successfully registered, the group member keeps the downloaded policy from the key server even if future registrations fail. However, if you use the **clear crypto gdoi** command on the group member, the subsequent registration attempt is considered a first-time attempt and fail-close mode is enforced.

You configure fail-close mode on the individual group members as described in [Configuring GET VPN Group Members, page 28-20](#). Thus, you can enable the mode on selected group members rather than on all of them. You must specify a fail-close ACL to ensure that you do not lock yourself (and Security Manager) out of the device, preventing configuration updates and maintenance until registration succeeds.

The fail-close ACL is an extended ACL policy object and is configured as part of a crypto map on the device. You configure the rules from the perspective of the group member. Use the following tips to help you create an appropriate fail-close ACL:

- You can configure both **permit** and **deny** statements. In the fail-close ACL, “permit” means “do not send this traffic,” whereas “deny” means “send this traffic in clear text.” This behavior is different from that of the typical crypto map ACL, where the statements have the following meaning:
  - **Permit**—Means “encrypt this traffic.” Because the group member does not have the IPsec security association required to encrypt the traffic prior to registration, the result is that the traffic is dropped.
  - **Deny**—Means “do not encrypt this traffic.” In a typical crypto map ACL, a deny statement results in the matching packet being compared to the next crypto map ACL configured on the device (if any). However, if traffic matches a deny statement in the fail-close ACL, all crypto map ACL processing ends and the traffic is allowed in clear text.

The reason deny works this way in fail-close mode is because fail-close includes an implicit ACL statement that gets added at the bottom of the list of crypto map ACLs. This statement is **permit ip any any**, which matches all traffic. Because there is no IPsec security association due to the fact that registration has yet to occur, there is no way to encrypt the remaining traffic and it is dropped.

Note that because of this final permit ip any any statement, you might be able to limit yourself to deny statements in your fail-close ACL.

- The fail-close ACL is processed sequentially after the optional group member security policy ACL. However, all statements in the group member security policy ACL must be deny statements, which indicate that matching traffic should be sent in clear text. Because the security policy is processed according to normal crypto map rules, traffic that matches deny statements is subsequently compared to the fail-close ACL. If the fail-close ACL does not have matching deny statements, the traffic will subsequently be dropped by the implicit final fail-close permit ip any any statement.

Therefore, if you use a group member security policy ACL, and you want the identified traffic to be sent in clear text regardless of the registration status of the group member, your fail-close ACL should contain all of the same statements contained in the security policy ACL at the least. It might even be possible to use the same ACL object for both ACLs.

For more information about group member security policies, see [Understanding the GET VPN Security Policy and Security Associations, page 28-10](#).

- The fail-close ACL is inserted as the final crypto map ACL. Thus, if you configure other features on the GET VPN interface that use crypto maps, any traffic identified on deny statements in those other ACLs will also get trapped (and dropped) by the fail-close ACL and the implicit final permit ip any any statement. Thus, configuring fail-close mode for GET VPN can influence the non-GET VPN services you configure on the interface.
- Upon successful registration, the fail-close ACL and the implicit final permit ip any any statement are removed from the crypto maps. These policies are not persistent.
- You should consider including the following rules in the fail-close ACL policy object. Remember that these rules are from the perspective of the group member:
  - SSH, SSL (HTTPS) traffic—You, and Security Manager, need to be able to access the device to configure it. To ensure that you do not lock down the device, include deny statements for SSH and SSL. For SSH, **deny tcp any eq 22 <host or network address>**. For SSL, **deny tcp any eq 443 <host or network address>**. If you specify host addresses, ensure that the Security Manager server is one of the hosts.
  - Routing traffic—To enable routing, allow the traffic for your routing process. For example, if you are using OSPF, **deny ospf any any**.
  - GDOI traffic—Regardless of the contents of the fail-close ACL, the device looks for GDOI registration messages, so you do not need to explicitly allow them to enable successful registration. However, if a group member (1) is in the path between the key server and another group member (2), a registration failure by group member (1) will prevent successful registration by the blocked group member (2). For registration on group member (2) to succeed, the fail-close ACL on group member (1) would have to allow GDOI traffic to pass. Thus, you might want to make it a general practice to allow GDOI traffic in the fail-close ACL: **deny udp any eq 848 any eq 848**.

# Understanding the GET VPN Security Policy and Security Associations

GET VPN uses crypto map access control lists (ACLs) to identify the traffic that needs to be encrypted in the VPN. These ACLs also identify traffic that should be sent as clear text instead of being encrypted (essentially, traffic that lies outside of the VPN). The collection of these ACLs define the security policy for the VPN.

GET VPN provides a multi-layered security policy. You define the general policy for the entire VPN on the key server, but you can also define a separate security policy on group members to account for local variations. The group member security policy always takes priority over the policy received from the key server. When the group member registers with the key server, the group member downloads the key server's security policy and associations and the group member creates a new, single security policy crypto map ACL by concatenating the individual security policies in this order: first, the group member's ACL; second, the key server's first ACL; third, and so forth, any additional ACLs from the key server in the order defined on the key server. It is important to understand that these merged ACLs are treated as a single ACL; they are not searched as separate ACLs. Thus, if traffic matches a deny statement from the group member's ACL, that traffic is never tested against any ACL rules downloaded from the key server.

## Tip

If a group member leaves the GET VPN, the ACLs downloaded from the key server are removed, but the group member security policy ACL is retained and remains configured on the device.

In GET VPN security policy ACLs (and crypto map ACLs in general), the permit and deny keywords have special meaning:

- **Permit**—Means “encrypt this traffic.” Permit entries are allowed only in the security policy ACLs defined on the key server (in the **Group Encryption Policy**), because encrypted traffic needs to have a full IPsec security association, which includes the transform set used for encrypting traffic, and anti-replay and IPsec lifetime configurations. If a packet matches a permit entry, but no IPsec SA exists for that packet, the packet is dropped.

Normally, your permit rules should be symmetric, that is, the source and destination addresses should be the same. If you need to specify different source and destination addresses, you must create two rules; the second rule should be a mirror image of the first rule, with the source and destination address switched.

- **Deny**—Means “do not encrypt this traffic.” In practice, this typically means that the traffic that matches the deny statement is sent in the clear. However, if you configure other features that use crypto maps, “denied” traffic is actually compared to subsequent (lower priority) crypto map ACLs to see if there is a match. IPsec security associations (SAs) are not generated for deny rules.

Following is a summary of the security policies that you can configure, in priority order:

- **Group member security policy**—When you configure the group member, as described in [Configuring GET VPN Group Members, page 28-20](#), you can optionally select an ACL policy object that defines the local group member security policy.

This group member ACL policy object is allowed to have deny statements only. You use this ACL to identify any traffic that you want to exclude from encryption and send in the clear. For example, if a handful of group members in the group are running a different routing protocol than the usual one, you can configure a local entry to these group members' security policy ACL to bypass encryption of the routing protocol traffic instead of defining the policy globally at the key server level.

- **Key server security policies and security associations**—When you configure the Group Encryption Policy for the GET VPN, as described in [Defining GET VPN Group Encryption, page 24-51](#), you configure ACLs that identify the traffic that should be encrypted and protected in the VPN.

The security policies on the key server are coupled with transform sets and other settings to define security associations; two IPsec security associations (SAs) are actually configured for every rule within the ACL, and these SAs define how the selected traffic should be encrypted. Thus, all group members use the same group SAs and they do not need to negotiate them with each other.

Because the key server policy is appended to the group member policy, the policy might be as simple as **permit ip any any**, that is, encrypt all traffic that has not been excluded by the group member policy.

However, you can create more complex sets of security policies and associations, setting up several separate ACL policy objects that are coupled to different transform sets to define different types of encryption.

If you create more than one security association, you must identify their order, and they are appended to the group policy in that order. Remember, the end result is a single ACL, so if you include a deny statement in the first ACL, any permit rules for the same traffic in subsequent security associations are ignored, and the traffic is sent in clear text rather than being encrypted.

**Note**

---

When you consider the security associations defined in the Group Encryption Policy as a whole, you can define up to 100 ACL permit entries. Each permit entry results in a pair of IPsec SAs; the maximum number of IPsec SAs in a group can not exceed 200. It is a best practice to summarize interesting traffic to as few permit entries as possible, and to build symmetric policies, where the source and destination addresses are the same. Unlike traditional IPsec policies, where source and destination address ranges must be uniquely defined, GET VPN is optimized when the source and destination address range are the same. If you configure a rule that has different source and destination addresses, you must also configure the mirrored rule (where the source and destination address are flipped), meaning that four SAs are consumed.

---

In addition to these security policies, there is an additional fail-close ACL that influences traffic patterns if you configure fail-close mode on a group member. For a complete discussion, see [Configuring Fail-Close to Protect Registration Failures, page 28-8](#).

## Understanding Time-Based Anti-Replay

Anti-replay is an important feature in a data encryption protocol such as IPsec (RFC 2401). Anti-replay prevents a third party from eavesdropping on an IPsec conversation, stealing packets, and injecting those packets into a session at a later time. The time-based anti-replay mechanism helps ensure that invalid packets are discarded by detecting the replayed packets that have already arrived at an earlier time.

GET VPN uses the Synchronous Anti-Replay (SAR) mechanism to provide anti-replay protection for multisender traffic. SAR is independent of real-world Network Time Protocol (NTP) clock or sequential-counter mechanisms (which guarantee packets are received and processed in order). A SAR clock advances regularly. The time tracked by this clock is called pseudotime. The pseudotime is maintained on the key server and is sent periodically to the group members within a rekey message as a timestamp field called `pseudoTimeStamp`. Group members have to be resynchronized to the pseudotime of the key server periodically. The pseudotime of the key server starts ticking from when the first group member registers. Initially, the key server sends the current pseudotime value of the key server and window size to group members during the registration process. New attributes, such as time-based replay-enabled information, window size, and the pseudotime of the key server, is sent under the SA payload (TEK).

The group members use the pseudotime to prevent replay as follows: the `pseudoTimeStamp` contains the pseudotime value at which a sender created a packet. A receiver compares the pseudotime value of senders with its own pseudotime value to determine whether a packet is a replayed packet. The receiver uses a time-based anti-replay window to accept packets that contain a timestamp value within that window. The window size is configured on the key server and is sent to all group members.

The following figure illustrates an anti-replay window in which the value `Ptr` denotes the local pseudotime of the receiver, and `W` is the window size.

You configure anti-replay in the security association definitions in the Group Encryption Policy. For more information, see [Defining GET VPN Group Encryption, page 24-51](#) and [Add New or Edit Security Association Dialog Box, page 24-55](#).

**Figure 28-3 Anti-Replay Window**

## Configuring GET VPN

To configure a full mesh VPN with group encrypted transport (GET), use the Create VPN wizard as described in [Creating or Editing VPN Topologies, page 24-28](#). When you finish the wizard, you are asked if you want to synchronize RSA keys, which is required for normal VPN functioning; for detailed information, see [Generating and Synchronizing RSA Keys, page 28-13](#).

If you select multicast as the rekey transport mechanism, you must enable multicast on all key servers and the desired group members. For more information, see [Choosing the Rekey Transport Mechanism, page 28-6](#).

You can change only the name and description of a GET VPN using the Edit VPN wizard. If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPsec settings, select **Global Settings for GET VPN**. See [Configuring Global Settings for GET VPN, page 28-16](#).
- For IKE proposal policies, select **IKE Proposal Policy for GET VPN**. See [Configuring the IKE Proposal for GET VPN, page 28-15](#).

- For security associations (ACL rules) and IPSec policies, select **Group Encryption Policy > Security Associations**. See [Defining GET VPN Group Encryption, page 24-51](#).
- For preshared key policies, select **IKEv1 Preshared Key**. See [Configuring IKEv1 Preshared Key Policies, page 25-44](#).
- For public key (PKI) policies, select **Public Key Infrastructure**. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50](#).
- For rekey settings, select **Group Encryption Policy > Group Settings**. See [Defining GET VPN Group Encryption, page 24-51](#) and [Generating and Synchronizing RSA Keys, page 28-13](#).
- For key server configuration, including RSA key synchronization, select **Key Servers**. See [Configuring GET VPN Key Servers, page 28-18](#) and [Generating and Synchronizing RSA Keys, page 28-13](#).
- For group membership and endpoint settings, select **Group Members**. See [Configuring GET VPN Group Members, page 28-20](#).

## Generating and Synchronizing RSA Keys

When you specify the RSA key label in the Group Encryption Policy (as described in [Defining GET VPN Group Encryption, page 24-51](#)), the corresponding RSA key (public and private keys) needs to be configured on all key servers in the GET VPN topology. The key can either be a pre-existing key that you defined on the device, or it could be a new key label, and Security Manager can generate the key for you and synchronize all key servers to use the same key.

You can use the following methods to have Security Manager generate and synchronize the RSA key:

- When creating a new GET VPN using the Create VPN wizard, you are asked at the end of the wizard if you want to synchronize the keys. If you click **Yes**, Security Manager does the key synchronization immediately, and generates a new key if the key does not already exist. For information on using the Create VPN wizard, see [Creating or Editing VPN Topologies, page 24-28](#).
- For an existing GET VPN, you can click the **Synchronize Keys** button on the Key Servers policy. Use this process whenever you add key servers or generate a new key on the primary key server. For information on configuring key server settings for existing topologies, see [Configuring GET VPN Key Servers, page 28-18](#).

#### Tip

For existing GET VPN topologies, if you want to generate a new RSA key, it might be easiest to update the Group Encryption Policy to specify a new, unused RSA key label, then click the Synchronize Keys button in the Key Servers policy. Because the key will not exist on any key server, Security Manager will generate the new key and import it into all key servers. You can then manually delete the old key from each key server.

Following are the uses for the RSA key:

- The key server uses the private RSA key to authenticate rekey messages from the group members.
- The key server provides the public RSA key to group members during registration.
- The key server uses the private key to sign the key encryption key (KEK) and traffic encryption key (TEK). The absence of an RSA key prevents the key server from creating the KEK and TEK.
- The RSA key is also used to sign messages between cooperative key servers.

When you start the RSA key synchronization process, the Synchronize Keys dialog box opens and shows you the overall progress as well as the results for each key server. (You can click the **Abort** button at any time to stop the process.) Security Manager performs the following steps:

1. Logs into all key servers and retrieves the RSA key information from each of them for the RSA key label configured for the VPN.
2. Determines whether any key server has a key with the required label:
  - If no key server has an RSA key with the required label, Security Manager generates the key on the primary key server (the one with the highest priority).
  - If one or more key server does not have the key, but all of the key servers that do have the key have the identical keys, Security Manager uses the existing key on any key server that has it.
  - If more than one key server has the key, but the contents of the key is different among the servers, you are asked if Security Manager can overwrite the keys. If you click **Yes**, Security Manager uses the existing key on the primary key server.

If you click **No**, you can log into the key servers outside of Security Manager and manually adjust the keys according to your requirements. However, all key servers must have the same key contents for the RSA key. See below for an explanation of the process.

3. Creates an exportable version of the key.
4. Imports the key into each of the remaining key servers.

**Tip**

For the synchronization process to succeed, the devices must be online and reachable and you must have Deploy authorization. If the device connection fails or times out, ensure that you can ping the key server from the Security Manager server. If it is your practice to deploy to file instead of to live devices, you might need to manually generate and synchronize the keys as described below. If you do not have sufficient authorization, you are prevented from initiating the process; someone else must do it.

### Manually Generating and Synchronizing the RSA Key

If you do not want Security Manager to generate and synchronize keys, or if for some reason Security Manager cannot complete the process, you can manually generate and synchronize keys using the following sequence in Privileged EXEC (enable) configuration mode:

1. Generate the key on a key server using the following command, where **rekeyrsa** is the name of the key (you can specify a name of your choosing). You must make the key exportable.

**crypto key generate rsa general-keys label rekeyrsa modulus 1024 exportable**

2. Create an exportable copy of the key using the following command, where **passphrase** is a string used to encrypt the key for import (you can specify your own pass phrase):

**crypto key export rsa rekeyrsa pem terminal 3des passphrase**

This command prints out the public and private keys to the terminal, where you can copy them to the clipboard for import into the other key servers. The keys are demarcated by **----BEGIN/END PUBLIC KEY----** and **----BEGIN/END RSA PRIVATE KEY----**. Note that you can also export to a URL; see the *Cisco IOS Security Command Reference* on Cisco.com for detailed usage information.

3. Import the key into each of the other key servers using the following command:

```
crypto key import rsa rekeyrsa pem exportable terminal passphrase
```

When copying and pasting the keys, include the begin/end lines.

## Configuring the IKE Proposal for GET VPN

Use the IKE Proposal for GET VPN page to define the IKE proposal to be used by the GET VPN topology. The IKE proposal is configured on the key servers and the group members.

These settings are for the ISAKMP security association (SA). If you are using a single key server, the ISAKMP SA is not used after initial group member registration. If you are using more than one key server (cooperative key servers), the ISAKMP SA is needed for communications among the key servers.

To open the IKE Proposal for GET VPN page:

- ([Site-to-Site VPN Manager Window](#)) Select an existing GET VPN topology and then select **IKE Proposal for GET VPN** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKE Proposal for GET VPN**, and then select an existing policy or create a new one.

The following table explains the settings you can configure in this policy.

**Table 28-1** IKE Proposal for GET VPN Policy

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE Proposal | <p>The IKE proposal policy object that defines the settings you want to use. There are several predefined objects that you might be able to use as is.</p> <p>Click <b>Select</b> to open the list of existing IKE proposal objects. The object you select needs to use the same authorization method you are configuring for the group (for example, an object name with the prefix <b>preshared</b> when using preshared keys, or with the prefix <b>cert</b> when using Public Key Infrastructure (PKI) certificates).</p> <p>When you select an object and click <b>OK</b>, the settings defined in the object are displayed in the IKE Proposal Settings display fields. You can also see the settings by editing them in the selection list. If you do not find an appropriate pre-existing object, click the <b>Add (+)</b> button in the selection list and create a new object (see <a href="#">Configuring IKEv1 Proposal Policy Objects, page 25-10</a> for more information and detailed descriptions of the options).</p> |

**Table 28-1** *IKE Proposal for GET VPN Policy (Continued)*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE Proposal Overrides | <p>The number of seconds that the ISAKMP SA for key servers and group members is valid. When the lifetime is exceeded, the SA expires and must be renegotiated between the peers. Values can be 1 to 86400.</p> <ul style="list-style-type: none"> <li>• If you are using cooperative key servers (more than one key server), set the key server lifetime high. The default 86400 is appropriate.</li> <li>• If you are using a single key server, you can set the lifetime low (but not less than 60 seconds) so that the ISAKMP SA is not retained unnecessarily. It is not used after a group member registers.</li> <li>• We recommend that you set the group member lifetime low as compared to the key server lifetime, especially when cooperative key servers are configured.</li> </ul> |

## Configuring Global Settings for GET VPN

Use the Global Settings for GET VPN page to define global settings for ISAKMP and IPsec that apply to devices in your GET VPN topology.

**Note**

The lifetime settings in this policy do not apply to the ISAKMP security association lifetime for the key server and group members. Those lifetime values are configured in the IKE Proposal for GET VPN policy. For more information, see [Configuring the IKE Proposal for GET VPN, page 28-15](#).

To open the Global Settings for GET VPN page:

- (Site-to-Site VPN Manager Window) Select an existing GET VPN topology and then select **Global Settings for GET VPN** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Global Settings for GET VPN**, and then select an existing policy or create a new one.

The following table explains the settings you can configure in this policy.

**Table 28-2 Global Settings for GET VPN**

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Keepalive (Key Servers Only) | <p>Whether to enable dead peer detection (DPD) keepalive messages between key servers. If there is more than one key server (cooperative key servers), you should enable periodic keepalive so the servers know each other's status and can elect a new primary server when necessary. Configure the following settings:</p> <ul style="list-style-type: none"> <li>• <b>Interval</b>—When you also select <b>Periodic</b>, the number of seconds between DPD messages. If you do not select Periodic, it is the number of seconds during which traffic is not received from the peer before DPD retry messages are sent. The range is from 10 to 3600 seconds.</li> <li>• <b>Retry</b>—The number of seconds between DPD retry messages if the DPD retry message is missed by the peer; the range is from 2 to 60 seconds. The default DPD retry message is sent every 2 seconds. Five aggressive DPD retry messages can be missed before the key server is marked as down.</li> <li>• <b>Periodic</b>—Whether to send DPD messages at regular intervals (regardless of traffic received from the other key servers). For GET VPN, you should select Periodic.</li> </ul> |
| Identity                            | <p>During Phase I IKE negotiations, peers must identify themselves to each other. Select the ISAKMP identity to use:</p> <ul style="list-style-type: none"> <li>• <b>Address</b>—(Default) The IP address of the interface that participates in IKE negotiations. Use the address if only one interface participates in negotiations, and its IP address is known (static).</li> <li>• <b>Hostname</b>—The fully-qualified host name (for example, router1.example.com).</li> <li>• <b>Distinguished Name</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SA Requests System Limit            | <p>The maximum number of SA requests allowed before IKE starts rejecting them. The specified value must equal or exceed the number of peers, or the VPN tunnels might be disconnected.</p> <p>You can enter a value in the range of 0-99999.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SA Requests System Threshold        | <p>The percentage of system resources that can be used before IKE starts rejecting new SA requests. The default is 75 percent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 28-2 Global Settings for GET VPN (Continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPsec Settings | <p>Select <b>Enable Lifetime</b> if you want to change the default lifetime settings for IPsec SAs. You can configure a lifetime based on the volume of traffic (in kilobytes) between group members, seconds, or both. The key expires when either of the values is reached. The defaults (which are configured even if you do not select this option) are:</p> <ul style="list-style-type: none"> <li>• <b>Lifetime (secs)</b>—3600 seconds (one hour).</li> <li>• <b>Lifetime (kbytes)</b>—4,608,000 kilobytes.</li> </ul> <p><b>Tip</b> You can override these values for the traffic encryption key when configuring a security association. See <a href="#">Defining GET VPN Group Encryption, page 24-51</a> and <a href="#">Add New or Edit Security Association Dialog Box, page 24-55</a>.</p> |

## Configuring GET VPN Key Servers

Use the Key Servers policy to define key servers to be used by a GET VPN topology.

To open the Key Servers policy, in the [Site-to-Site VPN Manager Window](#), select an existing GET VPN topology, then select **Key Servers** from the Policies list.

The table lists the key servers used in the VPN, showing the device name, identity, priority, and registration interface. For detailed information about these attributes, see [Edit Key Server Dialog Box, page 28-19](#).

- To add a key server to the table, click the **Add Row** button and select the device from the list presented. Only devices that can be included as key servers are shown.
- To edit the characteristics of a key server, select it and click the **Edit Row** button. Fill in the Edit Key Server dialog box (see [Edit Key Server Dialog Box, page 28-19](#)).
- To delete a key server, select it and click the **Delete Row** button.
- To synchronize the RSA keys among the key servers, so that they all use the identical key, click the **Synchronize Keys** button. For detailed information about the key synchronization process, including when and why you would do it, see [Generating and Synchronizing RSA Keys, page 28-13](#).
- To change the order of a key server when using cooperative key servers, select it and click the up or down arrow button. This order does not define which server is the primary key server (this is determined by the Priority value, the higher the value, the higher the likelihood that the server will be elected the primary key server).

Instead, the order determines the default order in which group members will try to register with a key server. Group members register with the first key server in the list. If the first key server cannot be reached, group members register with the second key server, and so on. For more information

about key server redundancy, see [Configuring Redundancy Using Cooperative Key Servers, page 28-7](#). Note that you can override this order for individual group members; see [Configuring GET VPN Group Members, page 28-20](#) and [Edit Group Member Dialog Box, page 28-21](#).

**Tip**

You can toggle between showing the interface roles or the actual interfaces defined by those roles in the Identity and interfaces columns using the **Show** field below the table.

## Add Key Server, Group Member Dialog Box

Use the Add Key Server and Add Group Member dialog boxes to select key servers or group members to be used in the GET VPN topology. Select the check box next to the desired devices and click **OK**.

**Navigation Path**

To add key servers or group members to a GET VPN topology, click the **Add Row (+)** button beneath the Key Server or Group Member table in the **GET VPN Peers** page of the Create VPN wizard, or for existing topologies, the **Key Servers** or **Group Members** policies. For detailed information, see the following topics:

- [Defining GET VPN Peers, page 24-57](#)
- [Configuring GET VPN Key Servers, page 28-18](#)
- [Configuring GET VPN Group Members, page 28-20](#)

## Edit Key Server Dialog Box

Use the Edit Key Servers dialog box to change the attributes defined for a key server in a GET VPN topology.

**Navigation Path**

- (Create VPN Wizard) Go to the GET VPN Peers Page, select a key server and click the **Edit Row** button. See [Defining GET VPN Peers, page 24-57](#).
- (Site-to-Site VPN Manager Window, page 24-18) Select the **Key Servers** policy, select a key server and click the **Edit Row** button. See [Configuring GET VPN Key Servers, page 28-18](#).

**Field Reference****Table 28-3** *Edit Key Server Dialog Box*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Identity Interface     | The interface that group members use to identify the key server and register with it. The default is the Loopback interface role, which identifies all Loopback interfaces.                                                                                                                                                                                                                                                                                           |
| Priority               | A number between 1-100 that designates the role of the key server, either primary or secondary. The key server with the highest number becomes the primary key server. If two or more key servers are assigned the same priority, the device with the highest IP address is used. The default priority is 100 for the first key server, 95 for the second, and so on.<br><br><b>Note</b> There can be more than one primary key server if the network is partitioned. |
| Registration Interface | The interface on which group domain of interpretation (GDOI) registrations can be accepted. If you do not specify a registration interface, GDOI registrations can occur on any interface.                                                                                                                                                                                                                                                                            |

## Configuring GET VPN Group Members

Use the Group Members policy to define the group members in a GET VPN topology.

To open the Group Members policy, in the [Site-to-Site VPN Manager Window](#), select an existing GET VPN topology, then select **Group Members** from the Policies list.

The group members table lists the members of the GET VPN, showing the device name, GET-enabled interface, local interface, and security policy. For detailed information about these attributes, see [Edit Group Member Dialog Box](#), page 28-21.

- To add a group member to the table, click the **Add Row** button and select the device from the list presented. Only devices that can be included as group members are shown.
- To edit the endpoint characteristics of a group member, select it and click the **Edit Row** button. Fill in the Edit Group Member dialog box (see [Edit Group Member Dialog Box](#), page 28-21).

If you select multiple group members in the table, you can also right-click and select the following commands to edit just these attributes:

- **Edit Key Server Order**—To change the key server list and priority order for the selected group members.
- **Edit Passive SA Mode**—To change whether the selected group members use passive SA mode.
- To delete a group member, select it and click the **Delete Row** button.

**Tip**

You can toggle between showing the interface roles or the actual interfaces defined by those roles in the interfaces columns using the **Show** field below the table.

## Edit Group Member Dialog Box

Use the Edit Group Members dialog box to change the attributes defined for a group member of a GET VPN topology.

Tip

If you selected multiple devices and chose an edit command from the right-click menu, this dialog box shows only those options related to the edit command you chose.

### Navigation Path

- (Create VPN Wizard) Go to the GET VPN Peers page, select a group member and click the **Edit Row** button. See [Defining GET VPN Peers, page 24-57](#).
- (Site-to-Site VPN Manager Window, page 24-18) Select a GET VPN topology, then select the **Group Members** policy. Select a group member and click the **Edit Row** button. See [Configuring GET VPN Group Members, page 28-20](#).

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Policy                     | <p>The local group member security ACL used to deny some group member-specific traffic over and above the security ACL downloaded from the key server. Denied traffic is sent in clear text rather than encrypted. For detailed information, see <a href="#">Understanding the GET VPN Security Policy and Security Associations</a>, page 28-10.</p> <p>Enter the name of the ACL object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Fail Close<br>Fail Close ACL | <p>Whether to enable fail-close mode on the device, which prevents the device from transmitting clear text traffic before the device successfully registers with the key server. Fail-close mode requires as a minimum Cisco IOS Software release 12.4(22)T or 15.0; you can also configure it on all supported ASRs.</p> <p><b>Tip</b> Fail-close mode is a complex feature, and you must carefully construct the fail-close ACL or you might lock yourself out of the device. Before enabling fail-close mode, read <a href="#">Configuring Fail-Close to Protect Registration Failures</a>, page 28-8.</p> <p>You must select an ACL policy object that identifies allowable clear text traffic (using deny statements), such as SSH and SSL communications with the Security Manager server to allow for configuration updates. Enter then name of the object or click <b>Select</b> to select it or to create a new object.</p> |
| Override Key Servers                | <p>Whether to override the key server list configured for the GET VPN topology as a whole for this particular group member.</p> <p>If you select this option, you can choose a subset of the key servers configured for the topology to be used by the selected group member, and change their priority order. This can help you load-balance registration activity among a group of cooperative key servers. For more information, see <a href="#">Configuring Redundancy Using Cooperative Key Servers</a>, page 28-7.</p> <p>Click <b>Select</b> to change the key server list and priority order of the key servers using the Key Servers Selection dialog box. A key server must be defined for the GET VPN topology before you can modify its use for a group member.</p>                                                                                                                                                      |

**Table 28-4** *Edit Group Member Dialog Box (Continued)*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Passive SA Mode | <p>Whether to put the group member into passive security association (SA) mode, which means the group member installs the SA in the inbound direction only. This means the group member can receive encrypted data, but it sends clear text data only. This mode is useful for testing the VPN only, primarily when you are migrating from an existing VPN to a GET VPN. (The group member must be running Cisco IOS Software version 12.4(22)T or 15.0 at minimum, or be a supported ASR, to use this mode.)</p> <p>This setting is similar to the <b>Receive Only</b> setting in the Group Encryption Policy, which applies to the topology as a whole. This group member option overrides the setting in the Group Encryption Policy.</p> <p>For detailed information on how you can use these passive mode features to migrate or test a GET VPN, see <a href="#">Using Passive Mode to Migrate to GET VPN, page 28-23</a>.</p> |

## Using Passive Mode to Migrate to GET VPN

If you are migrating an existing VPN to the GET VPN technology, especially a clear-text VPN, you can use two features to help you migrate in a phased approach to help prevent network down-time. The features are essentially the same, and involve the passive acceptance of encrypted traffic, but you configure them on different devices in the GET VPN.

Normally, in a fully-deployed GET VPN, traffic is encrypted in both directions (bidirectional security associations, or SAs). However, during testing, you can use passive mode. In passive mode, the group member installs the SA in the inbound direction only, so that the group member receives encrypted traffic but sends traffic in clear text. You can then test the VPN to ensure that it is performing as expected before turning on full encryption.

Use the following features to configure passive mode in a GET VPN:

- **SA Receive-only mode**—You configure receive-only mode for security associations on the key servers in the topology using the Group Encryption Policy. Thus, the setting applies to the entire topology.
- **Passive SA mode**—You configure passive security association mode on individual group members. This setting overrides the SA receive-only setting; thus, you can turn on full encryption for the entire topology, but leave some group members in passive mode. This lets you test the group members in stages and enable full encryption after you verify each member device.

**Tip**

Passive SA mode on group members requires Cisco IOS Software release 12.4(22)T+ or 15.0+, or Release 2.3 (12.2(33)XNC)+ on ASRs.

The following procedure shows an example of the end-to-end migration process you might follow to convert to GET VPN using these passive mode features.

### Related Topics

- [Understanding Group Encrypted Transport \(GET\) VPNs, page 28-2](#)
- [Configuring GET VPN, page 28-12](#)

- Step 1** Create the new GET VPN topology in Security Manager using the Create VPN wizard. When you are in the wizard, ensure that you make these selections:
- When selecting devices, choose the key servers for the topology, but for group members, select the first set of group members that will be migrated. For more information, see [Selecting Devices for Your VPN Topology, page 24-32](#).
  - When configuring the group encryption settings, select **Receive Only**. This enables the SA receive-only feature for the entire topology. For more information, see [Defining GET VPN Group Encryption, page 24-51](#).
- For information about creating VPNs, see [Creating or Editing VPN Topologies, page 24-28](#).
- Step 2** Deploy the configurations to all devices in the VPN. The group members should now be able to receive encrypted traffic but not send it. For information on the deployment process, see the following topics based on the Workflow mode you are using:
- [Deploying Configurations in Non-Workflow Mode, page 8-29](#)
  - [Deploying Configurations in Workflow Mode, page 8-35](#)
- Step 3** Outside of Security Manager, verify that all of the group members are functioning properly. For example, you can test whether the group members are able to send and receive encrypted packets using some CLI commands on the group member devices:
- On group member 1, configure the following command, where “groupexample” is the name of the GDOI group for the VPN. This command sets the device to accept encrypted or clear text, but to send only clear text.  
**crypto gdoi gm group groupexample ipsec direction inbound only**
  - On group member 2, configure the following command. This command sets the device to accept encrypted or clear text, but to send encrypted text.  
**crypto gdoi gm group groupexample ipsec direction inbound optional**
  - Ping group member 1 from group member 2. Group member 2 should encrypt the packet before sending it, and group member 1 should accept it and decrypt it. If you ping member 2 from member 1, the ping should be sent in clear text and accepted by member 2. Ensure that your ACLs allow pings.
- Step 4** In Security Manager, select **Manage > Site-to-Site VPNs** (see [Site-to-Site VPN Manager Window, page 24-18](#)).
- Select the GET VPN topology, then select **Group Members**.
- Add the remaining group members that you want to add to the topology (click the **Add Group Member (+)** button, select the devices, and click **OK**).
- If you want to use passive mode to test the new group members before enabling full encryption, ensure that you select **Enable Passive SA Mode** when configuring the group members:
- To configure an individual group member, select it and click the **Edit Group Member (pencil)** button.
  - To enable passive mode on more than one device at a time, use Shift+click or Ctrl+click to select multiple devices, then right-click and select **Edit Passive SA Mode**. You can then select the option and click **OK**.
- For more information on configuring group members, see [Configuring GET VPN Group Members, page 28-20](#).
- Step 5** Deploy the configuration changes to all devices in the VPN. All devices should be operating in passive mode at this point.

- Step 6** In the Site-to-Site VPN Manager, select the GET VPN topology, then select **Group Encryption Policy**. Deselect **Receive Only**. This turns off SA receive-only mode at the topology level.
- Step 7** Deploy the configuration changes to all devices in the VPN. Now the GET VPN should be operating in fully encrypted mode for the original group members that you tested. Any new members that you added with passive SA mode enabled should be receiving encrypted traffic and sending clear text traffic.
- Step 8** Use the following process to verify the new devices and to turn off passive mode. You can follow this process for all new devices at once, or you can do smaller groups of them at a time. You can also use this process for new group members as you extend your network. Iterate the following steps as appropriate:
- Verify that the new group members are functioning properly using the same techniques that you used to verify the original group members.
  - When you are ready to move a set of group members to fully-encrypted mode, in the Site-to-Site VPN Manager, select the GET VPN topology and select **Group Members**.
  - Select all passive mode group members that should use full encryption, right-click and select **Edit Passive SA Mode**. Deselect the **Enable Passive SA Mode** option and click **OK**.
  - Deploy configurations to all devices in the VPN, not just the ones whose passive mode you changed. Normally, you should not deploy to less than all devices in a VPN.
- 

## Troubleshooting GET VPN Configurations

If after provisioning and deploying GET VPN using Security Manager, the GET VPN is not working, check the following:

- Ensure that the RSA key is synchronized among all cooperative key servers (that is, the RSA key is the same). For information on how to synchronize keys, see [Generating and Synchronizing RSA Keys, page 28-13](#).
- If desired traffic is not being encrypted, make sure the key server security policy ACL (security association) has a permit ACE for the desired traffic. For asymmetric ACEs (where the source and destination addresses are different), ensure that there is a mirrored ACE (with the source and destination addresses reversed). For more information, see [Understanding the GET VPN Security Policy and Security Associations, page 28-10](#).
- For multicast rekey, make sure that the network is multicast enabled and that all key servers and most group members are configured to enable multicast. You must enable multicast on the devices directly; Security Manager does not provision the commands required to enable multicast. For more information, see [Choosing the Rekey Transport Mechanism, page 28-6](#).
- When using multicast rekey, check whether there is a deny ACE in the key server security ACL for the multicast group address to prevent encryption of multicast rekey messages.
- Check that the local security ACL on the group member has only deny ACEs. If you include a permit statement in an attempt to identify traffic that should be encrypted, the matching traffic is actually dropped because there is no corresponding IPsec SA. Because the permit entry is defined in the group member, the key server is not aware of it and cannot generate the required IPsec SA. For more information, see [Understanding the GET VPN Security Policy and Security Associations, page 28-10](#).
- For group member authorization using certificates, check that the ISAKMP authentication uses certificates and that a PKI policy is configured. ISAKMP identity on the group member and key server should be set to use the distinguished name (dn).

- Normally, network address translation (NAT) is not used in the type of WAN environments where GET VPN is deployed. However, if you use NAT, ensure that the security policy ACL has permit statements for the translated addresses. Also, if you are using Network Address Translation-Traversal (NAT-T), the GDOI protocol port changes to 4500.
- A control plane replay protection mechanism was added to Cisco IOS Software releases 12.4(15)T10, 12.4(22)T3, 12.4(24)T2, 15.0(1)M, and 12.2(33)XNE. This mechanism is not backward-compatible, so if any GET VPN group member in the network is running any of these (or later) releases, you must also upgrade all key servers to one of these (or newer) releases. Otherwise, network disruption might occur because of a failed rekey, which causes one of the following system logging (syslog) messages to appear:
  - %GDOI-3-GDOI\_REKEY\_SEQ\_FAILURE: Failed to process rekey seq # 2 in seq payload for group get-group, last seq # 6
  - %GDOI-3-PSEUDO\_TIME\_TOO\_OLD: Rekey received in group get-group is too old and failed PST check: my\_pst is 184 sec, peer\_pst is 25 sec, allowable\_skew is 10 sec

## CHAPTER 29

# Managing Remote Access VPNs: The Basics

---

Cisco Security Manager lets you configure both remote access IPSec VPNs and remote access SSL VPNs. Security Manager provides flexible configuration and management of remote access VPNs:

- You can discover existing remote access VPN configuration policies from existing live devices or from configuration files. Then, you can change and deploy new or updated policies, as necessary.
- You can use the configuration wizard to help you quickly and easily set up these two types of remote access VPNs with basic functionality.
- If you know the functions and feature your network requires, you can configure remote access VPNs independently. You can also use the wizard to create a basic remote access VPN and then configure additional features that are not included in the wizard separately.

In addition, Cisco Security Manager provides flexibility in how remote access VPN configuration policies are assigned: Device view or Policy view.

For some policies, you can also assign either the factory default policy (a private policy), or a shared policy that you created using Security Manager.

This chapter contains the following topics:

- [Understanding Devices Supported by Each Remote Access VPN Technology, page 29-8](#)
- [Overview of Remote Access VPN Policies, page 29-9](#)
- [Discovering Remote Access VPN Policies, page 29-12](#)
- [Using the Remote Access VPN Configuration Wizard, page 29-13](#)

## Understanding Remote Access VPNs

Security Manager supports two types of remote access VPNs: IPSec and SSL.

This section contains the following topics:

- [Understanding Remote Access IPSec VPNs, page 29-2](#)
- [Understanding Remote Access SSL VPNs, page 29-2](#)

## Understanding Remote Access IPsec VPNs

Remote access IPsec VPNs permit secure, encrypted connections between a company's private network and remote users, by establishing an encrypted IPsec tunnel across the Internet using broadband cable, DSL, dial-up, or other connections.

A remote access IPsec VPN consists of a VPN client and a VPN headend device, or VPN gateway. The VPN client software resides on a user's workstation and initiates the VPN tunnel access to the corporate network. At the other end of the VPN tunnel is the VPN gateway at the edge of the corporate site.

When a VPN client initiates a connection to the VPN gateway device, negotiation consists of authenticating the device through Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth). Next the group profile is pushed to the VPN client using mode configuration, and an IPsec security association (SA) is created to complete the VPN connection.

### Tip

For a remote access IPsec VPN hosted on an ASA 8.4(x) device, you have the option of configuring IKE version 2 (IKEv2). If you decide to use IKEv2, you must configure several SSL VPN policies in addition to the regular IPsec policies. The user also must use the AnyConnect 3.0+ VPN client to make an IKEv2 connection. For more information, see [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 29-24.

For remote access IPsec VPNs, AAA (authentication, authorization, and accounting) is used for secure access. With user authentication, a valid user name and password must be entered before the connection is completed. User names and passwords can be stored on the VPN device itself, or on an external AAA server that can provide authentication to numerous other databases. For more information on using AAA servers, see [Understanding AAA Server and Server Group Objects](#), page 6-24.

### Note

Site-to-site Easy VPN topologies use some of the same policies and policy objects that are used in remote access IPsec VPNs, but the policies are kept distinct from the remote access policies. In Easy VPN, the remote clients are hardware clients, such as routers, whereas in remote access IPsec VPNs, remote clients are workstations or other devices that use VPN client software. For more information, see [Understanding Easy VPN](#), page 27-1.

## Understanding Remote Access SSL VPNs

An SSL VPN lets users access enterprise networks from any Internet-enabled location. Users can make clientless connections, which use only a Web browser that natively supports Secure Socket Layer (SSL) encryption, or they can make connections using a full client (such as AnyConnect) or a thin client.

**Note**

---

SSL VPN is supported on ASA 5500 devices running software version 8.0 and later, running in single-context and router modes, on Cisco 870, 880, 890, 1800, 2800, 3700, 3800, 7200, and 7301 Series routers running software version 12.4(6)T and later, and on Cisco 1900, 2900, and 3900 Series routers running software version 15.0(1)M and later. For the 880 Series routers, the minimum software version is 12.4(15)XZ, which is mapped to 12.4(20)T in Security Manager.

---

On IOS devices, remote access is provided through an SSL-enabled VPN gateway. Using an SSL-enabled Web browser, the remote user establishes a connection to the SSL VPN gateway. After the remote user is authenticated to the secure gateway via the Web browser, an SSL VPN session is established and the user can access the internal corporate network. A portal page lets users access all the resources available on the SSL VPN networks.

On ASA devices, remote users establish a secure, remote access VPN tunnel to the security appliance using the Web browser. The SSL protocol provides the secure connection between remote users and specific, supported internal resources that you configure at a central site. The security appliance recognizes connections that need to be proxied, and the HTTP server interacts with the authentication subsystem to authenticate users.

User authentication can be done using usernames and passwords, certificates, or both.

**Note**

---

Network administrators provide user access to SSL VPN resources on a group basis instead of on an individual user basis.

---

This section contains the following topics:

- [Remote Access SSL VPN Example, page 29-3](#)
- [SSL VPN Access Modes, page 29-4](#)
- [Understanding and Managing SSL VPN Support Files, page 29-5](#)
- [Prerequisites for Configuring SSL VPNs, page 29-7](#)
- [SSL VPN Limitations, page 29-7](#)

## Remote Access SSL VPN Example

The following illustration shows how a mobile worker can access protected resources from the main office and branch offices. Site-to-site IPsec connectivity between the main and remote sites is unaltered. The mobile worker needs only Internet access and supported software (Web browser and operating system) to securely access the corporate network.

Figure 29-1 Secure SSL VPN Access Example

## SSL VPN Access Modes

SSL VPN provides three modes of remote access on IOS routers: Clientless, Thin Client and Full Client. On ASA devices, there are two modes: Clientless (which includes Clientless and Thin Client port forwarding) and AnyConnect Client (a full client).

### Clientless Access Mode

In Clientless mode, the remote user accesses the internal or corporate network using a Web browser on the client machine. No applet downloading is required.

Clientless mode is useful for accessing most content that you would expect in a Web browser, such as Internet access, databases, and online tools that employ a Web interface. It supports Web browsing (using HTTP and HTTPS), file sharing using Common Internet File System (CIFS), and Outlook Web Access (OWA) email. For Clientless mode to work successfully, the remote user's PC must be running Windows 2000, Windows XP, or Linux operating systems.

Browser-based SSL VPN users connecting from Windows operating systems can browse shared file systems and perform the following operations: view folders, view folder and file properties, create, move, copy, copy from the local host to the remote host, copy from the remote host to the local host, and delete. Internet Explorer indicates when a Web folder is accessible. Accessing this folder launches another window, providing a view of the shared folder, on which users can perform web folder functions, assuming the properties of the folders and documents permit them.

### Thin Client Access Mode

Thin Client mode, also called TCP port forwarding, assumes that the client application uses TCP to connect to a well-known server and port. In this mode, the remote user downloads a Java applet by clicking the link provided on the portal page. The Java applet acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The Java applet starts a new SSL connection for every client connection.

The Java applet initiates an HTTP request from the remote user client to the SSL VPN gateway. The name and port number of the internal email server is included in the HTTP request. The SSL VPN gateway creates a TCP connection to that internal email server and port.

Thin Client mode extends the capability of the cryptographic functions of the Web browser to enable remote access to TCP-based applications such as Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP), Internet Message Access protocol (IMAP), Telnet, and Secure Shell (SSH).

**Note**

The TCP port-forwarding proxy works only with Sun's Java Runtime Environment (JRE) version 1.4 or later. A Java applet is loaded through the browser that verifies the JRE version. The Java applet refuses to run if a compatible JRE version is not detected.

When using Thin Client mode, you should be aware of the following:

- The remote user must allow the Java applet to download and install.
- For TCP port-forwarding applications to work seamlessly, administrative privileges must be enabled for remote users.
- You cannot use Thin Client mode for applications such as FTP, where the ports are negotiated dynamically. That is, you can use TCP port forwarding only with static ports.

**Full Tunnel Client Access Mode**

Full Tunnel Client mode enables access to the corporate network completely over an SSL VPN tunnel, which is used to move data at the network (IP) layer. This mode supports most IP-based applications, such as Microsoft Outlook, Microsoft Exchange, Lotus Notes E-mail, and Telnet. Being part of the SSL VPN is completely transparent to the applications run on the client. A Java applet is downloaded to handle the tunneling between the client host and the SSL VPN gateway. The user can use any application as if the client host was in the internal network.

The tunnel connection is determined by the group policy configuration. The SSL VPN client (SVC) or AnyConnect client is downloaded and installed to the remote client, and the tunnel connection is established when the remote user logs in to the SSL VPN gateway. By default, the client software is removed from the remote client after the connection is closed, but you can keep it installed, if required.

**Note**

Full Tunnel SSL VPN access requires administrative privileges on the remote client.

## Understanding and Managing SSL VPN Support Files

SSL VPNs sometimes require supporting files that reside in the device's flash storage. This is especially true of SSL VPNs configured on ASA devices. Supporting files include Cisco Secure Desktop (CSD) packages, AnyConnect client images, and plug-in files. Security Manager includes many of these files for your use. However, some supporting files, such as graphic files used for portal pages, or client profiles used for AnyConnect clients are not provided by Security Manager.

Typically, you need to create a File Object to specify a supporting file, and you then select the File Object when you create a policy that refers to it. You can create the File Objects that you need when you create the policies, or you can create them before you start defining policies. For more information, see [Add and Edit File Object Dialog Boxes](#), page 33-25.

When you deploy policies to the devices, any supporting files referenced in your policies are copied to the device and placed in flash memory in the \csm folder. For the most part, you do not have to do any manual work to make this happen. The following are some situations where you might need to do some manual work:

- If you are trying to discover existing SSL VPN policies, or rediscover them, file references from the SSL VPN policies must be correct. For detailed information on how supporting files are handled during policy discovery, see [Discovering Remote Access VPN Policies](#), page 29-12.
- If you have configured the ASA device in an Active/Failover configuration, you must get the supporting files onto the failover device. The supporting files are not copied over to the failover device during a failover. You have these choices for getting the files onto the failover device:

- Manually copy the files from the \csm folder on the active unit to the failover unit.
- After deploying the policies to the active unit, force a failover and redeploy the policies to the now-active unit.
- If you are using a VPN cluster for load balancing, the same supporting files must be deployed to all devices in the cluster.

### Cisco Secure Desktop (CSD) Packages

These packages are for ASA SSL VPNs. You select a package in the Dynamic Access policy. The package you select must be compatible with the ASA operating system version running on the device. When you create a Dynamic Access policy for an ASA device, the version number that is compatible with the device's operating system is displayed in the Version field.

You can find the CSD packages in Program Files\CSCOPx\files\vms\repository\. The file names are in the form securedesktop-asa\_k9-version.pkg or csd\_version.pkg, where *version* is the CSD version number such as 3.5.1077.

Following is the CSD compatibility with ASA versions for the CSD packages shipped with Security Manager:

- csd\_3\_6\_181-3.6.181.pkg—ASA 8.4 or later.
- csd\_3\_5\_2008-3.5.2008.pkg—ASA 8.0(4) or later.
- csd\_3\_5\_2001-3.5.2001.pkg—ASA 8.0(4) or later.
- csd\_3\_5\_1077-3.5.1077.pkg—ASA 8.0(4) or later.
- csd\_3\_5\_841-3.5.841.pkg—ASA 8.0(4) or later.
- csd\_3\_4\_2048-3.4.2048.pkg—ASA 8.0(4) or later.
- csd\_3\_4\_1108-3.4.1108.pkg—ASA 8.0(4) or later.
- securedesktop\_asa\_k9-3.3.0.151.pkg—ASA 8.0(3.1) or later.
- securedesktop\_asa-k9-3.3.0.118.pkg—ASA 8.0(3.1) or later.
- securedesktop-asa-k9-3.2.1.126.pkg—ASA 8.0(3) or later.
- securedesktop-asa\_k9-3.2.0.136.pkg—ASA 8.0(2) or later.

For more information on CSD version compatibility with ASA versions, see the CSD release notes at [http://www.cisco.com/en/US/products/ps6742/prod\\_release\\_notes\\_list.html](http://www.cisco.com/en/US/products/ps6742/prod_release_notes_list.html) and [Supported VPN Platforms](#) on Cisco.com.

For more information on creating Dynamic Access policies to specify the CSD, see [Configuring Cisco Secure Desktop Policies on ASA Devices](#), page 31-8.

### AnyConnect Client Images

These images are for remote access SSL and IKEv2 IPsec VPNs hosted on an ASA. The AnyConnect client is downloaded to the user's PC and manages the client's VPN connection. Security Manager includes several AnyConnect images, which you can find in Program Files\CSCOPx\files\vms\repository\. The package names indicate the workstation operating system and the anyconnect release number in this general pattern:

anyconnect-client\_OS\_information-anyconnect\_release.pkg. For example, anyconnect-win-3.0.0610-k9-3.0.0610.pkg is the AnyConnect 3.0(0610) client for Windows workstations. The k9 indicates that the package includes encryption. In this example, the AnyConnect release number is repeated; in some file names, the release number appears once.

Packages are available for the following workstation operating systems (OS). For specific information on which OS versions that each client supports, see the documentation for the AnyConnect client on Cisco.com.

- Linux—Packages start with anyconnect-linux, or anyconnect-linux-64 for 64-bit versions.
- Mac OS—Packages start with anyconnect-macosx for Mac OS X on i386 workstations, and anyconnect-macosx-powerpc for Mac OS X on Power PC workstations.
- Windows—Packages start with anyconnect-win.

You can also download other AnyConnect client packages to the Security Manager server or your local Security Manager client and use them in remote access policies. However, Security Manager might not be able to configure newer parameters for those clients, although it might be possible to use FlexConfigs to configure newer parameters.

For more information on the AnyConnect client, its profiles, and how to configure policies to load the client onto the device, see the following topics:

- [Understanding SSL VPN AnyConnect Client Settings, page 30-52](#)
- [Configuring SSL VPN AnyConnect Client Settings \(ASA\), page 30-53](#)
- [Cisco AnyConnect Profile Editor, page 30-53](#)

#### Plug-in Files

These files are used as browser plug-ins. You can find plug-in files in Program Files\CSCOpX\files\vmS\Repository\. For complete information on the available files, see [Configuring SSL VPN Browser Plug-ins \(ASA\), page 30-50](#).

## Prerequisites for Configuring SSL VPNs

For a remote user to securely access resources on a private network behind an SSL VPN gateway, the following prerequisites must be met:

- A user account (login name and password).
- An SSL-enabled browser (such as Internet Explorer, Netscape, Mozilla, or Firefox).
- An email client (such as Eudora, Microsoft Outlook, or Netscape Mail).
- One of the following operating systems:
  - Microsoft Windows 2000 or Windows XP, with either JRE for Windows version 1.4 or later, or a browser that supports ActiveX controls.
  - Linux with JRE for Linux version 1.4 or later. To access Microsoft shared files from Linux in clientless remote access mode, Samba must also be installed.

## SSL VPN Limitations

SSL VPN configurations in Security Manager are subject to the following limitations:

- SSL VPN license information cannot be imported into Security Manager. As a result, certain command parameters, such as **vpn sessiondb** and **max-webvpn-session-limit**, cannot be validated.
- You must configure DNS on each device in the topology in order to use clientless SSL VPN. Without DNS, the device cannot retrieve named URLs, but only URLs with IP addresses.
- If you share your Connection Profiles policy among multiple ASA devices, bear in mind that all devices share the same address pool unless you use device-level object overrides to replace the global definition with a unique address pool for each device. Unique address pools are required to avoid overlapping addresses in cases where the devices are not using NAT.
- If the device configuration contains an address pool for SSL VPN with a name that begins CSM\_ (the naming convention used by Security Manager), Security Manager cannot detect whether the addresses in that pool overlap with the pool configured in your SSL VPN policy. (This can occur, for example, when the pool was configured by a user on a different installation of Security Manager.) This can lead to errors during deployment. Therefore, we recommend that you configure the same IP address pool as a network/host object in Security Manager and define it as part of the SSL VPN policy. This enables the proper validation to take place.
- The same IP address and port number cannot be shared by multiple SSL VPN gateways on the same IOS device. As a result, deployment errors can occur if a duplicate gateway exists in the device configuration but was not redefined using the Security Manager interface. If such an error occurs, you must choose a different IP address and port number and redeploy.
- If you define AAA authentication or accounting as part of an SSL VPN policy, the **aaa new-model** command is deployed to enable AAA services. Bear in mind that this command is not removed if you later delete the SSL VPN policy, as there might be other parts of the device configuration that require the **aaa new-model** command for AAA services.

**Note**

In addition, we recommend that you define at least one local user on the device with a privilege level of 15. This ensures that you will not be locked out of the device if the **aaa new-model** command is configured without an associated AAA server.

## Understanding Devices Supported by Each Remote Access VPN Technology

There are three types of remote access VPN: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. The devices on which you can configure these technologies differs, and broadly speaking, the configuration for each type of VPN differs for ASA/PIX 7.0+ compared to IOS/PIX 6.3 devices.

The following table describes the basic device support. When you select a device, the device type will determine which remote access policies are visible or configurable.

Tip

Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

**Table 29-1** *Devices Supported by Each Remote Access Technology*

| Technology          | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKE version 1 IPsec | <ul style="list-style-type: none"> <li>ASA/PIX 7.0+—ASA 5500 series and PIX 515, 515E, 525, or 535 with PIX Software 7.0+ (including 8.0+), running in single context and router modes.</li> <li>IOS/PIX 6.3—Cisco IOS security routers (including Aggregation Service Routers, or ASRs), Catalyst 6500/7600, and PIX Firewalls running PIX Software 6.3 only.</li> </ul>                                                                                                                                                                                                                                  |
| IKE version 2 IPsec | ASA 5500 series only, running ASA Software 8.4(x) only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SSL                 | <ul style="list-style-type: none"> <li>ASA—ASA 5500 series devices running software version 8.0 and later, running in single-context and router modes.</li> <li>IOS—Cisco 870, 880, 890, 1800, 2800, 3700, 3800, 7200, and 7301 Series routers running software version 12.4(6)T and later, and on Cisco 1900, 2900, and 3900 Series routers running software version 15.0(1)M and later. For the 880 Series routers, the minimum software version is 12.4(15)XZ, which is mapped to 12.4(20)T in Security Manager.</li> </ul> <p><b>Tip</b> No version of PIX is supported for SSL VPN configuration.</p> |

## Overview of Remote Access VPN Policies

The following list summarizes the various policies used in remote access VPN configuration based on the technology used in the VPN. Possible remote access VPN types are: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. Where indicated, many of these policies apply to specific device types only. To see an edited version of this list per device type, see the following topics:

- [Overview of Remote Access VPN Policies for ASA and PIX 7.0+ Devices, page 30-2](#)
- [Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices, page 32-2](#)

**Note**

You cannot configure SSL VPNs on PIX devices; PIX devices support remote access IKEv1 IPsec VPNs only.

- **Policies used with remote access IKEv1 and IKEv2 IPsec and SSL VPNs:**
  - **ASA Cluster Load Balancing** (ASA/PIX 7.0+)—In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device. For more information, see [Understanding Cluster Load Balancing \(ASA\)](#), page 30-4.
  - **Connection Profiles** (ASA/PIX 7.0+)—A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. For more information, see [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 30-6.
  - **Dynamic Access** (ASA 8.0+)—Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles that each user might inhabit within an organization, and logins from remote access sites with different configurations and levels of security. Dynamic access policies (DAP) let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. For more information, see [Chapter 31, “Managing Dynamic Access Policies for Remote Access VPNs \(ASA 8.0+ Devices\)”](#).
  - **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations. For more information, see [Configuring VPN Global Settings](#), page 25-29.
  - **Group Policies** (ASA/PIX 7.0+)—You can view the user group policies defined for your remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For more information, see [Configuring Group Policies for Remote Access VPNs](#), page 30-21.
  - **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see [Understanding Public Key Infrastructure Policies](#), page 25-47 and [Configuring Public Key Infrastructure Policies for Remote Access VPNs](#), page 25-52.
- **Policies used in remote access IPsec VPNs only:**
  - **Certificate To Connection Profile Maps, Policy and Rules** (IKEv1 IPsec only, ASA/PIX 7.0+ only.)—Certificate to connection profile map policies let you define rules to match a user’s certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group.

You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods. For more information, see [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 30-29.

- **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see [Configuring an IKE Proposal](#), page 25-9.
- **IPsec Proposal (ASA/PIX 7.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\)](#), page 30-33.
- **IPsec Proposal (IOS/PIX 6.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 32-3.
- **High Availability (IOS/PIX 6.3)**—High Availability (HA) is supported by the creation of an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see [Configuring High Availability in Remote Access VPNs \(IOS\)](#), page 32-11.
- **User Groups (IOS/PIX 6.x)**—A user group policy specifies the attributes that determine user access to and use of the VPN. For more information, see [Configuring User Group Policies](#), page 32-13.
- **Policies used in remote access IKEv2 IPsec and SSL VPNs only:**
  - **Access (ASA only.)**—An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or AnyConnect Essentials Client. For more information, see [Understanding SSL VPN Access Policies \(ASA\)](#), page 30-36.
  - **Other Settings (ASA only.)**—The SSL VPN Other Settings policy defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, AnyConnect client images and profiles, Kerberos Constrained Delegation, and some other advanced settings. For more information, see [Configuring Other SSL VPN Settings \(ASA\)](#), page 30-41.
  - **Shared License (ASA only.)**—Use the SSL VPN Shared License page to configure your SSL VPN Shared License. For more information, see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\)](#), page 30-62.
  - **SSL VPN (IOS devices only.)**—The SSL VPN policy table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. For more information, see [Configuring an SSL VPN Policy \(IOS\)](#), page 32-14.

# Discovering Remote Access VPN Policies

Security Manager allows you to import the configurations of remote access IPsec VPN policies during policy discovery. You can also discover SSL VPN policies on ASA devices, but not on IOS devices. To discover remote access VPN policies, select the **RA VPN Policies** option in the Discover Device settings when adding the device to the inventory or when discovering policies on a device already in the inventory. For more information on adding devices or discovering policies, see the following topics:

- [Adding Devices to the Device Inventory, page 3-6](#)
- [Discovering Policies on Devices Already in Security Manager, page 5-15](#)

You can discover configurations on devices that are already deployed in your remote access VPN network, so that Security Manager can manage them. These configurations are imported into Security Manager as remote access VPN policies. Remote access VPN policy discovery can be performed by importing the configuration of a live device or by importing a configuration file. However, SSL VPN policies that refer to files in flash storage cannot be discovered from configuration files, therefore, we recommend that you do not discover SSL VPNs from configuration files.

When you initiate policy discovery on a device in a remote access VPN, the system analyzes the configuration on the device and then translates this configuration into Security Manager policies so that the device can be managed. Warnings are displayed if the imported configuration completes only a partial policy definition. If additional settings are required, you must go to the relevant page in the Security Manager interface to complete the policy definition. You can also rediscover the configurations of devices that are already managed with Security Manager.

When discovering SSL VPN policies, files residing in flash storage that are referenced in SSL VPN policies are copied to the Security Manager server to be stored in the /csm directory on the target device when policies are deployed from Security Manager. If the flash storage contains files that you want to use, but they are not referenced by an SSL VPN policy, either configure commands that refer to them or manually copy them to the Security Manager server. Policy discovery fails if an SSL VPN policy on the device refers to a file that has been deleted from flash; in this case, either fix the configuration directly before discovering the device, or deselect the **RA VPN Policies** option when adding the device and create the desired SSL VPN configuration in Security Manager.

## Tips

- You should perform deployment immediately after you discover the policies on a device before you make any changes to policies or unassign policies from the device; otherwise, the changes that you configure in Security Manager might not be deployed to the device.
- For ASA and PIX 7.0+ devices, the default connection profiles and group policy are discovered and added to the Connection Profiles and Group Policies policy. You can modify these default profiles and group, but you cannot delete them:
  - DefaultRAGroup—The default connection profile for remote access IPsec VPNs.
  - DefaultWEBVPNGroup—The default connection profile for SSL VPNs. This connection profile is discovered only for ASA 8.0+ devices.
  - DfltGrpPolicy—The default group policy, which is used by the default connection profiles. When discovered, Security Manager uses the name `<device_display_name>DfltGrpPolicy`. However, when you deploy configurations, the device display name is stripped off and DfltGrpPolicy is used.

This naming convention is necessary because group policies are modeled as shared policy objects, and you might have modified the default group policy differently on your devices. However, the naming convention does not prevent you from using shared policies that incorporate the default group policy; the device display name is stripped from the object name

regardless of the device to which it is assigned. For example, if you use the object 10.100.10.1DfltGrpPolicy with device 10.200.11.1, Security Manager still uses “DfltGrpPolicy” in the configuration.

**Note** Although these default connection profiles use the DfltCustomization object for SSL VPN portal customization, Security Manager does not discover it. To modify DfltCustomization, you must do so directly on the device. However, you can simply create your own customization object and specify it in the default connection profile to use non-default settings.

## Using the Remote Access VPN Configuration Wizard

You can use the Remote Access VPN Configuration wizard to create the policies required to configure a basic IPsec or SSL VPN. The wizard provides simplified options to configure the basic settings. Thus, after using the wizard, you might need to configure additional settings in the individual remote access VPN policies.

#### Tip

The wizard never creates a valid IKEv2 IPsec VPN. You must always configure additional policies to complete an IKEv2 configuration.

Depending on the device type and VPN type (IPsec or SSL), the wizard takes you through the steps to configure a basic remote access VPN.

To access the Remote Access Configuration wizard:

1. In Device view, select the device to configure as your remote access server from the Device selector.
2. Select **Remote Access VPN > Configuration Wizard** from the Policy selector.
3. Select the radio button corresponding to the type of remote access VPN you want to create: **Remote Access SSL VPN** or **Remote Access IPsec VPN**.
4. Click **Remote Access Configuration Wizard** to open the appropriate wizard.

For detailed information on how to use each version of the wizard, see the following topics:

- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(ASA Devices\), page 29-14](#)
- [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\), page 29-24](#)
- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\), page 29-31](#)
- [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(IOS and PIX 6.3 Devices\), page 29-35](#)

## Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices)

This procedure describes how to create or edit SSL VPNs on ASA devices using the Remote Access SSL VPN Configuration Wizard.

### Related Topics

- [Understanding Remote Access SSL VPNs, page 29-2](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 29-8](#)

- 
- Step 1** In Device view, select the desired ASA device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access SSL VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The Access page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Access Page \(ASA\), page 29-15](#).
- Step 5** Specify the interfaces on which you want to enable the SSL VPN connections. Click **Select** to select an interface or an interface role object that identifies the interfaces.
- Step 6** Specify the port number you want to use for the SSL VPN sessions. Enter the port number or the name of a port list object that defines the number, or click **Select** to select the object or to create a new object. The default port is 443, for HTTPS traffic. The port number can be 443, or within the range of 1024-65535. If you change the port number, all current SSL VPN connections terminate, and current users must reconnect.

---

**Note** If HTTP port redirection is enabled, the default HTTP port number is 80.

---

- Step 7** To allow users to select a tunnel group from a list of tunnel group connection profiles configured on the device at login, select the **Allow Users to Select Connection Profile in Portal Page** option.
- Step 8** To allow users to use the AnyConnect VPN client to connect to the SSL VPN, select the **Enable AnyConnect Access** check box.
- Step 9** Click **Next**. The Connection Profile page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Connection Profile Page \(ASA\), page 29-16](#).
- Step 10** In **Connection Profile Name**, enter the name of the connection profile. This is the name of the tunnel group, and will appear in the Remote Access VPN > Connection Profiles policy. For more information about the connection profile policy, see [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 30-6](#).
- Step 11** On the Connection Profile page, configure these options that will later appear in the General tab of the connection profile (see [General Tab \(Connection Profiles\), page 30-9](#)):
- **Group Policy**—Enter the name of the ASA Group Policy policy object that will be the default group for the connection profile, or click **Select** to select the object. If the required object does not yet exist, click **Select**, then click the **Create (+)** button in the ASA User Groups Selector dialog box, which opens a wizard to guide you through the creation process as described in [Creating User Groups with the Create Group Policy Wizard, page 29-19](#).

For more information about ASA Group Policies objects, see [ASA Group Policies Dialog Box, page 33-1](#).

- **Group Policies**—This table lists all group policies currently used on the device, whether for SSL or IPsec VPNs. You can click **Edit** to add other group policies.
- **Global IP Address Pool**—Enter the address pools from which IP addresses are assigned. The server uses these address pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.

Specify the pools as address ranges or network/host objects that contain address ranges, in the format *Start\_Address-End\_Address*, for example, 10.100.10.2-10.100.10.254. Click **Select** to select network/host objects or to create new objects.

**Step 12** On the Connection Profile page, configure these options that will later appear in the SSL VPN tab of the connection profile (see [SSL Tab \(Connection Profiles\)](#), page 30-18):

- **Portal Page Customization**—The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. Click **Select** to select the object or to create a new object.

**Note**

You can set up different login windows for different groups by using a combination of customization profiles and tunnel groups. For example, assuming that you had created a customization profile called salesgui, you can create an SSL VPN tunnel group called sales that uses that customization profile.

- **Connection URL**—The URL of the connection profile. This URL provides users with direct access to the customized portal page. Select a protocol (**http** or **https**) from the list, and specify the URL including the name of the connection profile, in the field provided.

The URL is made up of the host name or IP address of the ASA device and port number, and the alias used to identify the SSL VPN connection profile.

**Note**

If you do not specify a URL, you can access the portal page by entering the portal page URL, and then selecting the connection profile alias from a list of configured connection profile aliases configured on the device. See [SSL VPN Configuration Wizard—Access Page \(ASA\)](#), page 29-15.

**Step 13** On the Connection Profile page, configure the AAA options for authentication, authorization, and accounting, and secondary authentication, which will later appear on the AAA and Secondary AAA tab of the connection profile (see [AAA Tab \(Connection Profiles\)](#), page 30-11 and [Secondary AAA Tab \(Connection Profiles\)](#), page 30-14).

**Step 14** Click **Finish** to save your changes.

## SSL VPN Configuration Wizard—Access Page (ASA)

Use the Access page of the SSL VPN Configuration Wizard to configure the security appliance interfaces for SSL VPN sessions. After you complete the wizard, you can later edit these settings in the SSL VPN Access policy; see [SSL VPN Access Policy Page](#), page 30-37.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see [Using the Remote Access VPN Configuration Wizard](#), page 29-13). The Access page is the first page that appears.

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces to Enable SSL VPN Service                    | The interfaces or interface roles that identify the interfaces on which you want to enable SSL VPN connections. Click <b>Select</b> to select interfaces or interface roles, or to create new interface roles.                                                                                                                                                                                                                                                                                                               |
| Port Number                                             | <p>The port number to use for the SSL VPN sessions. Enter a port number or port list object name, or click <b>Select</b> to select an object that defines the port, or to create a new object.</p> <p>The default port is 443, for HTTPS traffic. The port number can be 443, or within the range of 1024-65535. If you change the port number, all current SSL VPN connections terminate, and current users must reconnect.</p> <p><b>Note</b> If HTTP port redirection is enabled, the default HTTP port number is 80.</p> |
| Portal Page URLs                                        | The URLs that users would use to connect to the VPN. The URLs are displayed after you specify the interfaces and port number.                                                                                                                                                                                                                                                                                                                                                                                                |
| Allow Users to Select Connection Profile in Portal Page | Whether to present a list of configured connection profiles (tunnel groups) from which the user can select the appropriate profile when the user logs in (for example, in the SSL VPN portal page). If you do not select this option, the user cannot select a profile and must use the default profile for the connection.                                                                                                                                                                                                  |
| Enable AnyConnect Access                                | <p>Whether to allow the user to use the AnyConnect VPN client to make an SSL or IKEv2 IPsec VPN connection. The option is selected by default. For details about AnyConnect VPN clients, see <a href="#">Understanding SSL VPN AnyConnect Client Settings</a>, page 30-52.</p> <p><b>Note</b> To enable AnyConnect Essentials, go to Remote Access VPN &gt; SSL VPN &gt; Access. For details, see <a href="#">Configuring an Access Policy</a>, page 30-40.</p>                                                              |

**SSL VPN Configuration Wizard—Connection Profile Page (ASA)**

Use the Connection Profile page in the SSL VPN Configuration wizard to configure the tunnel group policies on your security appliance. You can specify a name for the tunnel connection profile policy that you are adding, select the user group policy, specify address pools for this policy, and specify authentication server group settings.

**Navigation Path**

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see [Using the Remote Access VPN Configuration Wizard](#), page 29-13); then click **Next** until you reach this page.

| Connection Profile Name   | The name of the connection profile (tunnel group).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Group Policy              | <p>Default ASA user group associated with the device. Enter an ASA user group policy or click <b>Select</b> to select one from a list or to create a new one.</p> <p>If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server.</p> <p>Click <b>Select</b> to select an existing object or to create a new one. If you click the <b>Create (+)</b> button in the group policy selection dialog box, you are guided through the group creation process using a wizard, as explained in <a href="#">Creating User Groups with the Create Group Policy Wizard, page 29-19</a>.</p>                                                                                                                                                                                                                                                    |
| Full Tunnel               | A read-only field that indicates whether full tunnel access mode is configured for the object selected in the Group Policy field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Group Policies            | <p>The names of all ASA user group policies that are configured for the device, even those that are configured for IPSec VPN connections only. The contents of this table is identical to the contents of the Remote Access VPN &gt; Group Policies policy. The table shows whether full tunnel access mode is enabled or disabled for each group policy.</p> <p>You can change the list by clicking <b>Edit</b>. This opens a dialog box where you can select additional group policies, or deselect currently selected policies (do not deselect policies that are used by other connection profiles). You can also create new group policies (click the <b>Create (+)</b> button below the available group policies list) or edit the group policy object by selecting it and clicking the <b>Edit (pencil)</b> button below either list.</p> <p>If you create a new group policy, the Create Group Policy wizard is used to guide you through the process. See <a href="#">Creating User Groups with the Create Group Policy Wizard, page 29-19</a>.</p> |
| Portal Page Customization | The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. This profile defines the appearance of the portal page that allows the remote user access to all resources available on the SSL VPN. Click <b>Select</b> to select the object or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 29-3 SSL VPN Configuration Wizard, Connection Profile Page (ASA) (Continued)

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection URL                  | <p>The URL of the connection profile. This URL provides users with direct access to the customized portal page.</p> <p>Select a protocol (<b>http</b> or <b>https</b>) from the list and specify the URL, including host name or IP address of the ASA device and port number and the alias used to identify the SSL VPN connection profile.</p> <p><b>Note</b> If you do not specify a URL, you can access the portal page by entering the portal page URL, and then selecting the connection profile alias from a list of configured connection profile aliases configured on the device. See <a href="#">SSL VPN Configuration Wizard—Access Page (ASA)</a>, page 29-15.</p>                                                                                                                                                 |
| Global IP Address Pool          | <p>The address pools from which IP addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>                                                                                                                                                                                |
| Authentication Server Group     | <p>The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Use LOCAL if Server Group Fails | <p>Whether to fall back to the local database for authentication if the selected authentication server group fails.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Authorization Server Group      | <p>The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Accounting Server Group         | <p>The name of the accounting server group. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Secondary Authentication        | <p>Whether to enable double authentication, which prompts the user for two sets of credentials (username and password) before completing the remote access VPN connection.</p> <ul style="list-style-type: none"> <li>• <b>Enable Secondary Authentication</b>—Select this option to require double authentication.</li> <li>• <b>Authentication Server Group</b>—The name of the authentication server group (LOCAL if the tunnel group is configured on the local device) to be used with the second set of credentials. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</li> <li>• <b>Use LOCAL if Server Group Fails</b>—Whether to fall back to the local database for authentication if the selected authentication server group fails.</li> </ul> |

## Creating User Groups with the Create Group Policy Wizard

When you are using the Remote Access SSL VPN Configuration wizard to create an SSL VPN on ASA or IOS devices, you can create new ASA group policy or IOS user group objects using a wizard. The wizard lets you configure select elements of the group, so you might need to edit the object after creating it to configure additional settings.

The Create Group Policy wizard is available only through the Remote Access SSL VPN Configuration wizard. For an explanation of how to start and use the wizard, see the following topics:

The following procedure assumes that you are already in the Remote Access SSL VPN Configuration wizard, as described in the following topics:

- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(ASA Devices\), page 29-14](#)
- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\), page 29-31](#)

### Related Topics

- [SSL VPN Access Modes, page 29-4](#)

- 
- Step 1** When using the Remote Access VPN Configuration wizard for SSL VPNs, proceed to the page where you select group policies. On this page, you can open the selection page for user groups by doing the following:
- ASA devices—On the Connection Profile page of the wizard, click **Select** next to the Group Policy field, or click **Edit** next to the Group Policies table.
  - IOS devices—On the Gateway and Context page of the wizard, click **Edit** next to the Group Policies table.
- Step 2** In the Group Policy Selector dialog box, click the **Create (+)** button below the list of available group policies to start the Create Group Policy wizard. The wizard starts at the Group Policy page. You can also do the following on the Group Policy Selector:
- Select existing groups and click >> to use them in the SSL VPN. When selecting a group for the default group on an ASA (the Group Policy field), you select the object simply by clicking it in the list.
  - Select an existing group and click **Edit (pencil)** to change its properties.
- Step 3** On the Group Policy page, configure the following options:
- **Name**—The name of the user group. Enter up to 128 characters, including uppercase and lowercase characters and most alphanumeric or symbol characters.
  - **Access Method**—Select the required remote access method options, as follows:
    - **Full Tunnel**—To access to the corporate network completely over an SSL VPN tunnel. This is the recommended option.
    - **Clientless**—To access the internal or corporate network using a web browser on the client machine.
    - **Thin Client**—To download a Java applet that acts as a TCP proxy on the client machine.
- Step 4** Click **Next**. The page that opens next depends on which access methods you selected. This procedure assumes that you selected all methods, in which case the Full Client page opens.

- Step 5** On the Full Client page, select whether to restrict access to full tunnel only or to allow other methods of access if the full client download fails. Also, specify DNS and WINS server information, and configure split tunneling if you want to allow it. For an explanation of the options, see [Create Group Policy Wizard—Full Tunnel Page, page 29-20](#).
- Step 6** Click **Next**. The Clientless and Thin Client page opens.
- Step 7** On the Clientless and Thin Client page, configure these access modes. For an explanation of the options, see [Create Group Policy Wizard—Clientless and Thin Client Access Modes Page, page 29-22](#).
- Step 8** Click **Finish** to create the group policy object.
- Step 9** When you complete the wizard, the group policy is added to the available groups list, but it is not selected (unless you are configuring the default group for an ASA). To select it, highlight it in the available groups list and click >> to move it to the selected groups list.
- 
-  **Note** To specify a user group as the default user group, select it and click **Set As Default**. This option is only available for IOS routers.
- 
- Step 10** Click **OK** in the Group Policy Selector page to save your changes and return to the Remote Access SSL VPN Configuration wizard.
- 

## Create Group Policy Wizard—Full Tunnel Page

**Note** This page is available only if you selected the **Full Client** option in the Group Policy of the Create Group Policy wizard.

---

In this page, you can configure the mode used to access the corporate network.

### Navigation Path

For information on starting the Create Group Policy wizard, see [Creating User Groups with the Create Group Policy Wizard, page 29-19](#).

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                          | <p>The access modes to allow in the SSL VPN. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Use Other Access Modes if SSL VPN Client Download Fails</b>—To allow the remote client to use clientless or thin client access modes if the download of the VPN client fails.</li> <li>• <b>Full Tunnel Only</b>—Prohibit clientless or thin client access. The user must have the full client installed and functional to connect to the VPN.</li> </ul> <p>Ensure that you configure the full client images on the device. For ASA devices, use the Client Settings tab of the SSL VPN &gt; Other Settings policy; see <a href="#">Configuring SSL VPN AnyConnect Client Settings (ASA), page 30-53</a>. For IOS devices, the client is managed using a FlexConfig policy; see <a href="#">Predefined FlexConfig Policy Objects, page 7-19</a>.</p> |
| Client IP Address Pools<br>(IOS device only.) | <p>The IP address ranges of the address pool that full tunnel clients will draw from when they log on. The address pool must be in the same subnet as one of the device's interface IP addresses.</p> <p>Enter the address range separating the first and last IP address with a hyphen, for example, 10.100.10.2-10.100.10.255. If you enter a single address, the pool has just one address. Do not enter subnet designations.</p> <p>You can also enter the name of a network/host policy object that defines the range, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple ranges with commas.</p>                                                                                                                                                                                                                        |
| Primary DNS Server                            | The IP address of the primary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Secondary DNS Server                          | The IP address of the secondary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Default DNS Domain                            | The domain name of the DNS server to be used for Full Client SSL VPN connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Primary WINS Server                           | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Secondary WINS Server                         | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 29-4 Create User Group Wizard—Full Tunnel Page (Continued)

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split Tunnel Option                      | <p>Whether to allow split tunneling and if so, which traffic should be secured or transmitted unencrypted across the public network:</p> <ul style="list-style-type: none"> <li>• <b>Disabled—(Default)</b> No traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks.</li> <li>• <b>Tunnel Specified Traffic</b>—Tunnel all traffic from or to the addresses listed in the <b>Networks</b> or <b>Destinations</b> field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider.</li> <li>• <b>Exclude Specified Traffic</b>—Traffic goes in the clear from and to the addresses listed in the <b>Networks</b> or <b>Destinations</b> field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.</li> </ul> |
| Networks<br>(ASA device only.)           | <p>If you select Tunnel Specified Traffic or Exclude Specified traffic in the Split Tunnel Option, enter the name of the ACL object that defines the traffic to be tunneled or excluded. Click <b>Select</b> to select the object or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Destinations<br>(IOS device only.)       | <p>If you select Tunnel Specified Traffic or Exclude Specified traffic in the Split Tunnel Option, specify the IP addresses that define the traffic to be tunneled or excluded.</p> <p>Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple addresses with commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Exclude Local LANs<br>(IOS device only.) | <p>Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the <b>Exclude Specified Traffic</b> split tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN.</p> <p>When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Split DNS Names                          | <p>A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server.</p> <p>Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Create Group Policy Wizard—Clientless and Thin Client Access Modes Page

In the Clientless and Thin Client page of the Create Group Policy wizard, you can configure the Clientless and Thin Client modes to be used for accessing the corporate network in your SSL VPN.

**Note**

This page is only available if you selected the **Clientless** or **Thin Client** options in step 1 of the Create Group Policy wizard.

**Navigation Path**

For information on starting the Create Group Policy wizard, see [Creating User Groups with the Create Group Policy Wizard, page 29-19](#).

**Field Reference**

**Table 29-5** Create User Group Wizard—*Clientless and Thin Client Page*

| Element                                                                                      | Description                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Clientless</b> —Appears only if you selected <b>Clientless</b> in step 1 of the wizard.   |                                                                                                                                                                                                                                                                                                                         |
| Portal Page Websites                                                                         | The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                             |
| Allow Users to Enter Websites                                                                | Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                                                                        |
| <b>Thin Client</b> —Appears only if you selected <b>Thin Client</b> in step 1 of the wizard. |                                                                                                                                                                                                                                                                                                                         |
| Port Forwarding List                                                                         | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. |
| Port Forwarding Applet Name<br>(ASA device only.)                                            | The application name or short description to display on the Port Forwarding Java applet screen on the portal, up to 64 characters. This is the name of the applet users will download to act as a TCP proxy on the client machine for the services configured on the SSL VPN gateway.                                   |
| Download Port Forwarding Applet on Client Login                                              | Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.                                                                                               |

## Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices)

This procedure describes how to create IPsec VPNs on ASA or PIX 7.0+ devices using the Remote Access VPN Configuration Wizard.

### Tip

The wizard allows you to select shared policies to use in the VPN on the Defaults page (the final step of the wizard). If you want to use this feature, you must first ensure that all required shared policies are configured and submitted to the database. For information on configuring shared policies and VPN policy defaults, see [Understanding and Configuring VPN Default Policies, page 24-12](#).

### Related Topics

- [Understanding Remote Access IPsec VPNs, page 29-2](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 29-8](#)

- 
- Step 1** In Device view, select the desired ASA or PIX 7.0+ device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access IPsec VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The Connection Profile page opens. For a description of the options that appear on this page, see [Remote Access VPN Configuration Wizard—IPsec VPN Connection Profile Page \(ASA\), page 29-27](#).
- Step 5** On the Connection Profile page, configure these basic options:
- **Connection Profile name**—Enter the name of the connection profile. This is the name of the tunnel group, and will appear in the Remote Access VPN > Connection Profiles policy. For more information about the connection profile policy, see [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 30-6](#).
  - **IKE Versions**—Select the IKE versions to use during IKE negotiations between the VPN server and the remote users, version 1, 2 or both. IKEv2 is supported on ASA Software release 8.4(1)+ only.
- Step 6** On the Connection Profile page, configure these options that will later appear in the General tab of the connection profile (see [General Tab \(Connection Profiles\), page 30-9](#)):
- **Group Policy**—Enter the name of the ASA Group Policy policy object that will be the default group for the connection profile, or click **Select** to select the object. If the required object does not yet exist, click **Select**, then click the **Create (+)** button in the ASA User Groups Selector dialog box to open the dialog boxes that are used to create these objects.
- When creating a new group policy object, you must select the same IKE versions that you select in the Connection Profile page of the wizard. These options are on the Technology page of the Add ASA Group Policies dialog box: Easy VPN/IPsec IKEv1 and Easy VPN/IPsec IKEv2.
- For more information about ASA Group Policies objects, see [ASA Group Policies Dialog Box, page 33-1](#).
- **Global IP Address Pool**—Enter the address pools from which IP addresses are assigned. The server uses these address pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.

Specify the pools as address ranges or network/host objects that contain address ranges, in the format *Start\_Address-End\_Address*, for example, 10.100.10.2-10.100.10.254. Click **Select** to select network/host objects or to create new objects.

- Step 7** On the Connection Profile page, configure the AAA options for authentication, authorization, and accounting, which will later appear on the AAA tab of the connection profile (see [AAA Tab \(Connection Profiles\)](#), page 30-11).
- Step 8** Click **Next** to move to the IPsec Settings page.
- Step 9** On the IPsec Settings page, configure the options for IPsec, which will later appear on the IPsec tab of the connection profile (see [IPsec Tab \(Connection Profiles\)](#), page 30-16). Note that some of these settings apply to IKEv1 only.
- **Preshared Key, Confirm**—Enter the IKEv1 preshared key for the tunnel group in each field. The maximum length of a preshared key is 127 characters.  
You cannot configure a preshared key for remote access IKEv2 IPsec VPNs.
  - **Trustpoint Name**—Enter the name of the PKI enrollment policy object that defines the trustpoint name, if any trustpoints are configured, for an IKEv1 connection. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the object from a list or to create a new object.  
For IKEv2, the trustpoint name is not configured here, but on the IKEv2 Settings tab of the Global Settings policy. The configuration is explained later in this procedure.
  - The other options (other than the client table) apply to both IKEv1 and IKEv2. Change the settings if you need non-default behavior. For an explanation of the options, including the client software update table, see [Remote Access VPN Configuration Wizard—IPsec Settings Page \(ASA\)](#), page 29-28.
- Step 10** Click **Next** to move to the VPN Defaults page.
- Step 11** On the Defaults page, select the additional shared policies that you want to assign to the VPN. Initially, the policies listed are those chosen on the Security Manager Administration VPN Defaults page.  
For more information about selecting these policies, see [Remote Access VPN Configuration Wizard—Defaults Page](#), page 29-30.
- Step 12** Click **Finish** to save your changes.  
Because the wizard does not configure all possible options, inspect the policies created and configure any additional options that you want to implement.  
The remaining steps are required if you selected IKE version 2 as a supported IKE version, or if you specified an IPsec trustpoint.
- Step 13** (IKEv2 Optional.) Configure group aliases and double authentication if required:
- a. Select the Connection Profiles policy.
  - b. Select the connection profile you configured in the wizard, and click the **Edit Row (pencil)** button to open the Connection Profiles dialog box.
    - If you want to configure double authentication, select the Secondary AAA tab and configure the required settings. For more information, see [Secondary AAA Tab \(Connection Profiles\)](#), page 30-14.
    - If you want to configure aliases for the profile, which helps users select the correct profile during login, select the SSL tab and configure the alias table. For more information, see [SSL Tab \(Connection Profiles\)](#), page 30-18.

- There are several additional connection profile settings that are not configured in the wizard. Examine the tabs in the Connection Profile dialog box to determine if additional changes are required.

c. Click **OK** in the Connection Profiles dialog box to save your changes.

**Step 14** (IKEv2 Requirement.) Select the **Remote Access VPN > SSL VPN > Access** policy and configure at least the following. For detailed information about configuring an Access policy, see [Understanding SSL VPN Access Policies \(ASA\)](#), page 30-36.

- Add the remote access VPN interface to the access interfaces table.
- Select **Allow Users to Select Connection Profile in Portal Page**.
- Select **Enable AnyConnect Access**.

**Step 15** (IKEv2 Requirement.) Select the **Remote Access VPN > SSL VPN > Other Settings** policy, and click the **Client Settings** tab.

In the AnyConnect Client Image table, add an AnyConnect 3.0 or higher client image, one that supports IKEv2 negotiations.

For more information on configuring client images, see [Configuring SSL VPN AnyConnect Client Settings \(ASA\)](#), page 30-53.

**Step 16** (IKEv2 Requirement.) Select the **Remote Access VPN > Global Settings** policy, and click the IKEv2 Settings tab.

At minimum, configure the **RA Trustpoint** for remote access IKEv2 authentication. Enter the name of the PKI enrollment object that identifies the certificate authority (CA) server or click **Select** to select the object or to create a new one.

For more information on configuring IKEv2 global settings, see [Configuring VPN Global IKEv2 Settings](#), page 25-34.

**Step 17** (IKEv1, IKEv2 Requirement.) Select the **Remote Access VPN > Public Key Infrastructure** policy and ensure that the following PKI enrollment objects are selected:

- (IKEv1) The object specified on the IPsec tab of the connection profile, if a trustpoint is configured.
- (IKEv2) The object specified on the IKEv2 Settings tab of the Global Settings policy.

---

**Note** In the wizard, you might have applied a shared Public Key Infrastructure policy that already specifies these objects.

---

**Step 18** (IKEv2 Optional.) IKEv2 connections require the use of the AnyConnect 3.0+ client. The AnyConnect client might need to download files, such as software upgrades, profiles, localization and customization files, CSD, SCEP, and so forth. The wizard does not enable these types of download.

To enable AnyConnect file downloads:

- Select **Remote Access VPN > IPsec VPN > IPsec Proposal**.
  - Select the IPsec proposal created by the wizard, and click **Edit Row (pencil)** to open the IPsec Proposal Editor. For information about the various options, see [IPsec Proposal Editor \(ASA, PIX 7.0+ Devices\)](#), page 30-33.
  - Select the **Enable Client Services** option, and enter a port number if you do not want to use the default port 443. (You can use the same port number used for SSL VPN or other SSL uses.)
  - Click **OK** to save your changes.
-

## Remote Access VPN Configuration Wizard—IPSec VPN Connection Profile Page (ASA)

Use the Connection Profile page of the Remote Access VPN Configuration wizard to configure the connection profile policies on your security appliance for a remote access IPsec VPN. You can specify a name for the connection profile policy that you are adding, select the IKE versions to allow during IKE negotiations, select the user group policy, specify address pools for this policy, and specify authentication, authorization, and accounting server group settings.

For more information about using the wizard to configure remote access IPsec VPNs on ASA, see [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 29-24.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN on an ASA or PIX 7.0+ device (see [Using the Remote Access VPN Configuration Wizard](#), page 29-13). The IPsec Connection Profile page is the first page that appears.

### Field Reference

**Table 29-6** Remote Access VPN Configuration Wizard, IPsec Connection Profile Page (ASA)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Profile Name | The name of the connection profile (tunnel group).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| IKE Versions            | <p>The IKE versions to use during IKE negotiations between the VPN server and the remote users. IKEv2 is supported on ASA Software release 8.4(1)+ only; you cannot change the option selection on other types of device.</p> <p>Select <b>IKE Version 1</b>, <b>IKE Version 2</b>, or <b>Both</b> (to allow either version). IKEv2 connections are allowed using Anyconnect clients only.</p>                                                                                                                                                                                                                                                               |
| Group Policy            | <p>If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server.</p> <p>Click <b>Select</b> to select an existing object or to create a new one.</p> <p><b>Tip</b> If you enable IKEv2 for this VPN, there are special considerations for the group policy you choose. For detailed information, see <a href="#">Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices)</a>, page 29-24.</p> |
| Global IP Address Pool  | <p>The address pools from which IP addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>             |

**Table 29-6 Remote Access VPN Configuration Wizard, IPSec Connection Profile Page (ASA)**

| Element                         | Description                                                                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Server Group     | The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object. |
| Use LOCAL if Server Group Fails | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                  |
| Authorization Server Group      | The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.  |
| Accounting Server Group         | The name of the accounting server group. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.                                                                   |

## Remote Access VPN Configuration Wizard—IPSec Settings Page (ASA)

Use the IPSec Settings page of the Remote Access VPN Configuration wizard to configure the IPSec settings on your security appliance for a remote access IPSec VPN. Some of these settings apply to IKE version 1 (IKEv1) only; if you are configuring an IKEv2-only VPN, these fields are greyed and unconfigurable.

For more information about using the wizard to configure remote access IPsec VPNs on ASA, see [Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\)](#), page 29-24.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN on an ASA or PIX 7.0+ device (see [Using the Remote Access VPN Configuration Wizard](#), page 29-13); then click **Next** until you reach this page.

### Field Reference

**Table 29-7 Remote Access VPN Configuration Wizard, IPSec VPN Wizard—IPSec Settings (ASA)**

| Element                     | Description                                                                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preshared Key (IKEv1 only.) | The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field.<br><br><b>Tip</b> You cannot configure preshared keys for IKEv2 remote access VPNs. |

**Table 29-7 Remote Access VPN Configuration Wizard, IPsec VPN Wizard—IPsec Settings (ASA)**

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trustpoint Name<br>(IKEv1 only.)                  | <p>The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv1 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate.</p> <p>Click <b>Select</b> to select the object from a list or to create a new object.</p> <p><b>Tip</b> This trustpoint is used for IKEv1 negotiations only. To configure the global trustpoint for IKEv2 negotiations, use the IKEv2 Settings tab of the Global Settings policy; see <a href="#">Configuring VPN Global IKEv2 Settings, page 25-34</a>.</p> |
| IKE Peer ID Validation                            | Select whether IKE peer ID validation is ignored (Do not check), required, or checked only if supported by a certificate. During IKE negotiations, peers must identify themselves to one another.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable Sending Certificate Chain                  | Whether to enable the sending of the certificate chain for authorization. A certificate chain includes the root CA certificate, identity certificate, and key pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Password Update with RADIUS Authentication | <p>When selected, enables passwords to be updated with the RADIUS authentication protocol.</p> <p>Whether to enable passwords to be updated with the RADIUS authentication protocol. For more information, see <a href="#">Supported AAA Server Types, page 6-25</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ISAKMP Keepalive                                  | <p>Whether to monitor ISAKMP keepalive. If you select the <b>Monitor Keepalive</b> option, you can configure IKE keepalive as the default failover and routing mechanism. Enter the following parameters:</p> <ul style="list-style-type: none"> <li>• <b>Confidence Interval</b>—The number of seconds that a device waits between sending IKE keepalive packets.</li> <li>• <b>Retry Interval</b>—The number of seconds a device waits between attempts to establish an IKE connection with the remote peer. The default is 2 seconds.</li> </ul> <p>For more information, see <a href="#">Configuring VPN Global ISAKMP/IPsec Settings, page 25-30</a>.</p>                                                   |
| Client Software Update table<br>(IKEv1 only.)     | <p>The VPN client revision level and URLs for client platforms. You can configure different revision levels for All Windows Platforms, Windows 95/98/ME, Windows NT4.0/2000/XP, or the VPN3002 Hardware Client.</p> <p>To configure the client for a platform, select it, click the <b>Edit Row</b> button, and fill in the <a href="#">IPsec Client Software Update Dialog Box, page 30-18</a>.</p>                                                                                                                                                                                                                                                                                                             |

## Remote Access VPN Configuration Wizard—Defaults Page

Use the Defaults page of the Remote Access VPN Configuration wizard to select the shared policies to assign to the remote access IPsec VPN. Initially, the policies selected are those configured in the Security Manager Administration VPN Defaults for remote access VPNs. For information on how to configure these defaults, see [Understanding and Configuring VPN Default Policies, page 24-12](#).

Required policies must always have a policy selected. If “Factory Default” is shown, then the policy applied is not a shared policy but default policy settings supplied by Security Manager. If you can select the empty option, the policy is optional and you need to configure it only if you want the associated features.

When evaluating which policies to assign (if any), keep the following in mind:

- The drop-down lists for each policy type list the existing shared policies that you can select. You can select only shared policies that have been committed to the Security Manager database (and approved, if you are using Workflow mode with an approver). You cannot create a shared policy and use it before you submit it.
- To view the content of a policy, select it and click the **View Content** button. You are presented with a read-only view of the policy. Use this to help verify that you are selecting the desired policy.

### Note

If you try to select a default policy that is currently locked by another user, a message is displayed warning you of a lock problem. To bypass the lock, select a different policy or cancel the VPN creation until the lock is removed. For more information, see [Understanding Policy Locking, page 5-7](#).

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN (see [Using the Remote Access VPN Configuration Wizard, page 29-13](#)) and click **Next** until you reach this page.

**Table 29-8 Remote Access VPN Configuration Wizard, Defaults Page**

| Element                                      | Description                                                                                                          |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| ASA Cluster Load Balance                     | Defines load balancing for an ASA device in your remote access VPN.                                                  |
| High Availability                            | Defines a High Availability (HA) policy on a Cisco IOS router in a remote access VPN.                                |
| Certificate to Connection Profile Map Policy | (IKEv1 only.) Defines the certificate to connection profile map options for an ASA device in your remote access VPN. |
| IKE Proposal                                 | Defines the set of algorithms that two peers use to secure the IKE negotiation between them.                         |

**Table 29-8 Remote Access VPN Configuration Wizard, Defaults Page (Continued)**

| Element                   | Description                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPsec Proposal            | Defines the crypto maps required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. |
| Public Key Infrastructure | Defines the Public Key Infrastructure (PKI) policy used to generate PKI enrollment requests for PKI certificates and RSA keys.                                                                         |
| VPN Global Settings       | Defines global settings for IKE, IPsec, IKEv2, NAT, and fragmentation that apply to devices in your remote access VPN.                                                                                 |

## Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices)

This procedure describes how to create or edit SSL VPNs on IOS devices using the Remote Access SSL VPN Configuration Wizard.

### Related Topics

- [Understanding Remote Access SSL VPNs, page 29-2](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 29-8](#)

- 
- Step 1** In Device view, select the desired IOS device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access SSL VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The Gateway and Context page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Gateway and Context Page \(IOS\), page 29-32](#).
- Step 5** Select the gateway to be used as a proxy for connections to the protected resources in your SSL VPN. Options are:
- **Use Existing Gateway**—Lets you use an existing gateway object. If you select this option, specify the name of the SSL VPN Gateway policy object that defines the gateway. Click **Select** to select the object or to create a new object.
  - **Create Using IP Address**—Lets you configure a new gateway object using a reachable (public, static) IP address on the router. Enter the IP address.
  - **Create Using Interface**—Lets you configure a new gateway using the public, static IP address of a router interface. Select the interface or interface role object.
- If you elected to create a new gateway using an IP address or an interface:
- Specify a gateway name.
  - Specify the number of the port that will carry the HTTPS traffic. The default is 443, unless HTTP port redirection is enabled, in which case the default HTTP port number is 80. If you want to use a different port, it must be between 1024 and 65535.
- Step 6** Enter the name of the name of the context that defines the virtual configuration of the SSL VPN.

- Step 7** Select the user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client access is enabled for the group. Click **Edit** to select the desired groups, or to create new groups.
- Step 8** Configure the AAA options for authentication, authentication domain, and accounting. For detailed information, see [SSL VPN Configuration Wizard—Gateway and Context Page \(IOS\)](#), page 29-32.
- Step 9** Click **Next**. The Portal Page Customization page opens. For a description of the elements on this page, see [SSL VPN Configuration Wizard—Portal Page Customization Page \(IOS\)](#), page 29-34.
- Step 10** On the Portal Customization page, configure the following options. The bottom of the page is a preview of what the portal page will look like based on your selections; use the preview to fine-tune your selections.
- **Title**—The name of the portal page, which appears at the top of the page.
  - **Logo**—The graphic to show in the title area of the page: None, Default (the Cisco logo graphic), or Custom. If you select custom, click **Select** to select the graphic on the Security Manager server. You must copy the custom graphic to the server before you can use it in the portal customization.  
  
The source image file for the logo can be a GIF, JPG, or PNG file, with a file name of up to 255 characters, and up to 100 kilobytes in size.
  - **Login Message**—The text that should appear above the login prompt.
  - **Title and Text Colors**—The colors to use for the title and login area and the fonts.
- Step 11** Click **Finish** to save your changes.
- 

## SSL VPN Configuration Wizard—Gateway and Context Page (IOS)

A gateway and context must be configured on a device before a remote user can access resources on a private network behind the SSL VPN. Use this step of the SSL VPN Configuration wizard to specify a gateway and context configuration, including information that will allow users to access a portal page.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an IOS device (see [Using the Remote Access VPN Configuration Wizard](#), page 29-13). The Gateway and Context page is the first page that appears.

| Gateway      | <p>The gateway to be used as a proxy for connections to the protected resources in your SSL VPN. Options are:</p> <ul style="list-style-type: none"> <li>• <b>Use Existing Gateway</b>—When selected, enables you to use an existing gateway for your SSL VPN.</li> <li>• <b>Create Using IP Address</b>—When selected, enables you to configure a new gateway using a reachable (public static) IP address on the router.</li> <li>• <b>Create Using Interface</b>—When selected, enables you to configure a new gateway using the public static IP address of the router interface.</li> </ul>                                     |
| Gateway Name | <p>The name of the SSL VPN gateway policy object that defines the gateway:</p> <ul style="list-style-type: none"> <li>• If you selected Use Existing Gateway, click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> <p><b>Note</b> After selecting the gateway, the port number and digital certificate required to establish a secure connection are displayed in the relevant fields.</p> <ul style="list-style-type: none"> <li>• If you selected Create Using IP Address or Interface, enter the name of the object that you want to create (up to 128 characters).</li> </ul>              |
| IP Address   | <p>Available if you selected to create a gateway using an IP address.</p> <p>The IP address on the router that should be used as the gateway address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interface    | <p>Available if you selected to create a gateway using an interface.</p> <p>The name of the interface, or the interface role object that defines the interface, that should be used as the SSL VPN gateway. Click <b>Select</b> to select the interface or interface role, or to create a new interface role.</p>                                                                                                                                                                                                                                                                                                                    |
| Port         | <p>The port number used for SSL VPN connections. The default is 443, unless HTTP port redirection is enabled, in which case the default HTTP port number is 80. If you enter a different number, it must be between 1024 and 65535.</p> <ul style="list-style-type: none"> <li>• If you selected Use Existing Gateway, this is a read-only field that shows the port number configured in the selected object.</li> <li>• If you selected Create Using IP Address or Interface, enter the port number or the name of a port list object that specifies the number, or click <b>Select</b> to select the port list object.</li> </ul> |
| Trustpoint   | <p>The digital certificate required to establish the secure connection. A self-signed certificate is generated when an SSL VPN gateway is activated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 29-9** *SSL VPN Configuration Wizard, Gateway and Context Page (Continued)*

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context Name                | The name of the context that defines the virtual configuration of the SSL VPN.<br><br><b>Note</b> To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.                                                                                                                                                                                                              |
| Portal Page URL             | The URL for the SSL VPN, which is filled in when you select (or define) a gateway object. Users connect to this URL to enter the VPN.                                                                                                                                                                                                                                                                                                           |
| Group Policies              | The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client access is enabled for the group. Click <b>Edit</b> to select the desired groups, or to create new groups.                                                                                                                                              |
| Authentication Server Group | The authentication server groups. The list is in prioritized order. Authentication is attempted using the first group and proceeds through the list until the user is successfully authenticated or denied. Use the LOCAL group if the users are defined on the gateway itself.<br><br>Enter the names of the AAA server groups; separate multiple entries with commas. You can click <b>Select</b> to select the groups or to create new ones. |
| Authentication Domain       | A list or method for SSL VPN remote user authentication. If you do not specify a list or method, the gateway uses global AAA parameters for remote-user authentication.                                                                                                                                                                                                                                                                         |
| Accounting Server Group     | The accounting server group. Enter the name of the AAA server group policy object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                   |

## SSL VPN Configuration Wizard—Portal Page Customization Page (IOS)

Use this step of the SSL VPN Configuration wizard to define the appearance of the portal page that remote users see when connecting to the SSL VPN. The portal page allows remote users access to all websites available on the SSL VPN networks.

### Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see [Using the Remote Access VPN Configuration Wizard, page 29-13](#)); then click **Next** until you reach this page.

**Field Reference****Table 29-10** *SSL VPN Configuration Wizard, Portal Page Customization Page*

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title         | The text displayed at the top of the page. Control the color using the Primary settings in the Title Color and Text Color fields.                                                                                                                                                                                                                                                      |
| Logo          | The graphic displayed next to the title. Select None, Default, or Custom. To configure a custom graphic, you must copy the desired graphic to the Security Manager server, then click <b>Browse</b> to select the file. Supported graphic types are GIF, JPG, and PNG, with a maximum size of 100 KB.                                                                                  |
| Login Message | The text displayed immediately above the login prompt. Control the color using the Secondary settings in the Title Color and Text Color fields.                                                                                                                                                                                                                                        |
| Title Color   | The colors used for the title and login area and the text: <ul style="list-style-type: none"> <li>• Primary—The Title, Login Box title, and the text in those areas.</li> <li>• Secondary—The Login Box username/password background and the text in that area.</li> </ul> Click <b>Select</b> to choose background colors. For text, select either Black or White from the text list. |
| Text Color    |                                                                                                                                                                                                                                                                                                                                                                                        |
| Preview       | A preview of how the portal page will appear based on your selections.                                                                                                                                                                                                                                                                                                                 |

## Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices)

This procedure describes how to create or edit IPSec VPNs on IOS and PIX 6.3 devices using the Remote Access VPN Configuration Wizard.

**Tip**

The wizard allows you to select shared policies to use in the VPN on the Defaults page (the final step of the wizard). If you want to use this feature, you must first ensure that all required shared policies are configured and submitted to the database. For information on configuring shared policies and VPN policy defaults, see [Understanding and Configuring VPN Default Policies, page 24-12](#).

**Related Topics**

- [Understanding Remote Access IPSec VPNs, page 29-2](#)
- [Understanding Devices Supported by Each Remote Access VPN Technology, page 29-8](#)

- 
- Step 1** In Device view, select the desired IOS or PIX 6.3 device.
- Step 2** From the Policy selector, select **Remote Access VPN > Configuration Wizard**.
- Step 3** Select the **Remote Access IPSec VPN** radio button.
- Step 4** Click **Remote Access Configuration Wizard**. The User Group Policy page opens.
- Step 5** Select the required user groups from the Available User Groups list and click >>.

- If the required user group is not in the list, click **Create (+)** to open the Add User Groups dialog box, which enables you to create or edit a user group object. See [Add or Edit User Group Dialog Box, page 33-58](#).
- You can edit an existing user group by selecting it in either list and clicking **Edit (pencil)**.
- To deselect a user group, select it and click <<.

**Step 6** Click **Next**. The Defaults page opens.

**Step 7** Select the shared policies to assign to the VPN. Initially, the selected policies are those configured on the Security Manager Administration VPN Defaults page. You can use the defaults or select different policies, if any are available. For more information about these policy defaults, see [Remote Access VPN Configuration Wizard—Defaults Page, page 29-30](#).

**Step 8** Click **Finish** to save your changes.

Inspect the policies created and configure any additional options that you want to implement.

---

# CHAPTER 30

## Managing Remote Access VPNs on ASA and PIX 7.0+ Devices

You can configure and manage remote access IPsec on devices running Cisco ASA Software or PIX 7.0+, and SSL VPNs on ASA 8.0+ devices (but not on PIX devices). Additionally, you can use IKE version 2 (IKEv2) negotiations in remote access IPsec VPNs on ASA 8.4(x) devices.

**Tip**

No VPN configuration is supported on Cisco Catalyst 6500 Series ASA Service Modules and the ASA Software Release 8.5(x) used on the module.

The configuration of these remote access VPNs are the same for these device types. IOS and PIX 6.3+ devices use different configurations for remote access VPNs (as explained in [Chapter 32, “Managing Remote Access VPNs on IOS and PIX 6.3 Devices”](#)).

The topics in this chapter explain how to configure policies that are specific to ASA and PIX 7.0+ devices. Additionally, review the following topics for more information about remote access VPNs:

- [Customizing Clientless SSL VPN Portals, page 30-65](#)

## Overview of Remote Access VPN Policies for ASA and PIX 7.0+ Devices

When you configure remote access VPNs on ASA or PIX 7.0+ devices, you use the following policies based on the type of VPN you are configuring. Possible remote access VPN types are: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. IKEv2 is supported on ASA 8.4(x) devices only. [Table 30-1](#) explains the conditions under which these policies are required or optional.

### Note

You cannot configure SSL VPNs on PIX devices; PIX devices support remote access IKEv1 IPsec VPNs only.

- **Policies used with remote access IKEv1 and IKEv2 IPsec and SSL VPNs:**
  - **ASA Cluster Load Balancing**—In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device. For more information, see [Understanding Cluster Load Balancing \(ASA\), page 30-4](#).
  - **Connection Profiles**—A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. For more information, see [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 30-6](#).
  - **Dynamic Access**—Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles that each user might inhabit within an organization, and logins from remote access sites with different configurations and levels of security. Dynamic access policies (DAP) let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. For more information, see [Chapter 31, “Managing Dynamic Access Policies for Remote Access VPNs \(ASA 8.0+ Devices\)”](#).
  - **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations. For more information, see [Configuring VPN Global Settings, page 25-29](#).
  - **Group Policies**—You can view the user group policies defined for your remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For more information, see [Configuring Group Policies for Remote Access VPNs, page 30-21](#).

- **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see [Understanding Public Key Infrastructure Policies, page 25-47](#) and [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52](#).
- **Policies used in remote access IPsec VPNs only:**
  - **Certificate To Connection Profile Maps, Policy and Rules** (IKEv1 IPsec only.)—Certificate to connection profile map policies let you define rules to match a user’s certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods. For more information, see [Configuring Certificate to Connection Profile Map Policies \(ASA\), page 30-29](#).
  - **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see [Configuring an IKE Proposal, page 25-9](#).
  - **IPsec Proposal (ASA/PIX 7.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 30-33](#).
- **Policies used in remote access IKEv2 IPsec and SSL VPNs only:**
  - **Access**—An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or AnyConnect Essentials Client. For more information, see [Understanding SSL VPN Access Policies \(ASA\), page 30-36](#).
  - **Other Settings**—The SSL VPN Other Settings policy defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, AnyConnect client images and profiles, Kerberos Constrained Delegation, and some other advanced settings. For more information, see [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#).
  - **Shared License**—Use the SSL VPN Shared License page to configure your SSL VPN Shared License. For more information, see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\), page 30-62](#).

The following table explains whether a policy is required or optional for a particular type of VPN.

**Table 30-1 Remote Access VPN Policy Requirements for ASA Devices**

| Policy                     | Required, Optional                 |
|----------------------------|------------------------------------|
| ASA Cluster Load Balancing | <b>Optional</b> for all VPN types. |
| Connection Profiles        | <b>Required</b> for all VPN types. |

**Table 30-1 Remote Access VPN Policy Requirements for ASA Devices (Continued)**

| <b>Policy</b>                                            | <b>Required, Optional</b>                                                                                                               |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic Access                                           | <b>Optional</b> for all VPN types.                                                                                                      |
| Global Settings                                          | <b>Required:</b> IKEv2 IPsec.<br><b>Optional:</b> IKEv1 IPsec, SSL.                                                                     |
| Group Policies                                           | <b>Required</b> for all VPN types.                                                                                                      |
| Public Key Infrastructure                                | <b>Required:</b> IKEv2 IPsec.<br>Also required if you configure any trustpoints for IKEv1 IPsec or SSL VPNs. Otherwise, it is optional. |
| Certificate To Connection Profile Maps, Policy and Rules | <b>Optional:</b> IKEv1 IPsec.<br><b>Not used in:</b> IKEv2 IPsec, SSL.                                                                  |
| IKE Proposal                                             | <b>Required:</b> IKEv1 IPsec, IKEv2 IPsec.<br><b>Not used in:</b> SSL.                                                                  |
| IPsec Proposal (ASA/PIX 7.x)                             | <b>Required:</b> IKEv1 IPsec, IKEv2 IPsec.<br><b>Not used in:</b> SSL.                                                                  |
| Access                                                   | <b>Required:</b> IKEv2 IPsec, SSL.<br><b>Not used in:</b> IKEv1 IPsec.                                                                  |
| Other Settings                                           | <b>Required:</b> IKEv2 IPsec, SSL.<br><b>Not used in:</b> IKEv1 IPsec.                                                                  |
| Shared License                                           | <b>Optional:</b> IKEv2 IPsec, SSL.<br><b>Not used in:</b> IKEv1 IPsec.                                                                  |

## Understanding Cluster Load Balancing (ASA)

In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device.

To implement load balancing, you must group two or more devices on the same private LAN-to-LAN network into a virtual cluster. All devices in the virtual cluster carry session loads. One device in the virtual cluster, called the virtual cluster master, directs incoming calls to the other devices, called secondary devices. The virtual cluster master monitors all devices in the cluster, keeps track of how busy each is, and distributes the session load accordingly.

The virtual cluster appears to outside clients as a single virtual cluster IP address. This IP address is not tied to a specific physical device—it belongs to the current virtual cluster master. A VPN client trying to establish a connection connects first to this virtual cluster IP address. The virtual cluster master then sends back to the client the public IP address of the least-loaded available host in the cluster. In a second transaction (transparent to the user), the client connects directly to that host. In this way, the virtual cluster master directs traffic evenly and efficiently across resources.

The role of virtual cluster master is not tied to a physical device—it can shift among devices. If a machine in the cluster fails, the terminated sessions can immediately reconnect to the virtual cluster IP address. The virtual cluster master then directs these connections to another active device in the cluster. Should the virtual cluster master itself fail, a secondary device in the cluster immediately takes over as the new virtual session master. Even if several devices in the cluster fail, users can continue to connect to the cluster as long as any one device in the cluster is available.

### Understanding Redirection Using a Fully Qualified Domain Name (FQDN)

By default, the ASA sends only IP addresses in load-balancing redirection to a client. If certificates are in use that are based on DNS names, the certificates will be invalid when redirected to a secondary device. As a VPN cluster master, this security appliance can send a fully qualified domain name (FQDN) of a cluster device (another security appliance in the cluster) when redirecting VPN client connections to that cluster device. The security appliance uses reverse DNS lookup to resolve the FQDN of the device to its outside IP address to redirect connections and perform VPN load balancing. All outside and inside network interfaces on the load-balancing devices in a cluster must be on the same IP network.

After you enable load balancing using FQDNs, add an entry for each of your ASA outside interfaces into your DNS server, if such entries are not already present. Each ASA outside IP address should have a DNS entry associated with it for lookups. These DNS entries must also be enabled for Reverse Lookup. Enable DNS lookups on your ASA and define your DNS server IP address on the ASA.

For the procedure to configure cluster load balancing, see [Configuring Cluster Load Balance Policies \(ASA\)](#), page 30-5.

## Configuring Cluster Load Balance Policies (ASA)

Use the ASA Cluster Load Balance page to enable load balancing for an ASA device in your remote access VPN. You must explicitly enable load balancing, as it is disabled by default. All devices that participate in a cluster must share the same cluster-specific values: IP address, encryption settings, encryption key, and port. For more information on cluster load balancing, see [Understanding Cluster Load Balancing \(ASA\)](#), page 30-4.

### Note

Load balancing requires an active 3DES/AES license and an ASA Model 5510 with a Plus license or an ASA Model 5520 or higher. The ASA device checks for the existence of this crypto license before enabling load balancing. If it does not detect an active 3DES or AES license, the device prevents load balancing, and also prevents internal configuration of 3DES by the load balancing system unless the license permits this usage.

- 
- Step 1** Do one of the following:
- (Device View) Select an ASA device; then select **Remote Access VPN > ASA Cluster Load Balance** from the Policy selector.
  - (Policy View) Select **Remote Access VPN > ASA Cluster Load Balance** from the Policy Type selector. Select an existing policy or create a new one.
- The ASA Cluster Load Balance page opens.
- Step 2** Select **Participate in Load Balancing Cluster** to indicate that the device belongs to a load-balancing cluster.
- Step 3** Configure the VPN Cluster Configuration options:
- **Cluster IP Address**—Specify the single IP address that represents the entire virtual cluster. Choose an IP address that is in the same subnet as the external interface.

- **UDP Port**—Specify the UDP destination port for the virtual cluster to which the device belongs. The port is typically 9023, but if that port is in use by another application, enter the UDP destination port number that you want to use for load balancing.
  - **Enable IPsec Encryption, IPsec Shared Secret**—If required, select **Enable IPsec Encryption** to ensure that all load-balancing information communicated between the devices is encrypted. If you select this option, also enter (and confirm) the shared secret password. This can be a case-sensitive value between 4 and 16 characters, without spaces. The security appliances in the virtual cluster communicate through LAN-to-LAN tunnels using IPsec. This password must match the passwords passed on by the client.
- Step 4** Configure the priority of the server in the cluster. Select one of the following options:
- **Accept default device value**—To accept the default priority value assigned to the device.
  - **Configure same priority on all devices in the cluster**—To configure the same priority value to all the devices in the cluster. Then enter the priority number (1-10) to indicate the likelihood of the device becoming the virtual cluster master, either at startup or when the existing master fails.
- Step 5** Specify the public and private interfaces to be used on the server:
- **Public Interfaces**—The public interfaces to be used on the server. Enter the name of an interface or interface role object, or click **Select** to select the interface or role or to create a new role.
  - **Private Interfaces**—The private interfaces to be used on the server. Enter the name of an interface or interface role object, or click **Select** to select the interface or role or to create a new role.
- Step 6** If required, select **Send FQDN to client instead of an IP address when redirecting** to enable redirection using fully-qualified domain names. This option is available only for ASA devices running 8.0(2) or later. For more information, see [Understanding Cluster Load Balancing \(ASA\)](#), page 30-4.

## Configuring Connection Profiles (ASA, PIX 7.0+)

A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. If you do not assign a group policy to a user, the default connection profile for the connection applies. You can create one or more connection profiles specific to your environment. You can configure connection profiles on the local remote access VPN server or on external AAA servers.

When you discover remote access VPN policies on a device, Security Manager adds the default connection profiles to the policy. You can edit these profiles, and the associated DfltGrpPolicy (renamed in Security Manager as *<device\_display\_name>DfltGrpPolicy*), but you cannot delete them. The following default connection profiles are supported in Security Manager:

- **DefaultRAGroup**—The default connection profile for remote access IPsec VPNs.
- **DefaultWEBVPNGroup**—The default connection profile for SSL VPNs. This connection profile is discovered only for ASA 8.0+ devices.

If you are configuring a connection profile on an ASA device, you have the option of configuring double authentication. The double authentication feature implements two-factor authentication for remote access to the network, in accordance with the Payment Card Industry Standards Council Data Security Standard. This feature requires that the user enter two separate sets of login credentials at the login page. For example, the primary authentication might be a one-time password, and the secondary authentication might be a domain (Active Directory) credential. If the primary credential authentication fails, the security appliance does not attempt to validate the secondary credentials. If either authentication fails,

the connection is denied. Both the AnyConnect VPN client (SSL VPN or IKEv2 IPsec VPN) and Clientless SSL VPN support double authentication. The AnyConnect client supports double authentication on Windows computers (including supported Windows Mobile devices and Start Before Login), Mac computers, and Linux computers.

This procedure describes how to create or edit connection profiles on your remote access VPN server using the Connection Profile policy.

**Note**

You can also create connection profiles from the Remote Access VPN Configuration wizard; see [Using the Remote Access VPN Configuration Wizard, page 29-13](#). For information on connection profiles in Easy VPN site-to-site topologies, see [Configuring a Connection Profile Policy for Easy VPN, page 27-13](#).

**Related Topics**

- [Discovering Remote Access VPN Policies, page 29-12](#)

- Step 1** Do one of the following:
- (Device view) With an ASA or PIX 7.0+ device selected, select **Remote Access VPN > Connection Profiles** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Connection Profiles (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- The Connection Profiles page opens. The policy lists all connection profiles and shows the group policy used in the profile. For more information, see [Connection Profiles Page, page 30-8](#).
- Step 2** Click **Add Row (+)** beneath the table, or select a profile and click **Edit Row (pencil)**. The Connection Profiles dialog box opens.
- Step 3** (All remote access VPN types.) On the General tab, specify the connection profile name and group policies and select which method (or methods) of address assignment to use. For a detailed explanation of the configuration, see [General Tab \(Connection Profiles\), page 30-9](#).
- Step 4** (All remote access VPN types.) Click the **AAA** tab to specify the AAA authentication parameters for the connection profile. For a detailed explanation of the configuration, see [AAA Tab \(Connection Profiles\), page 30-11](#).
- Step 5** (Remote access IKEv2 IPsec and SSL VPN only.) If you are setting up a connection profile on an ASA device, you can configure secondary authentication. To do so, click the **Secondary AAA** tab. For a detailed explanation of the configuration, see [Secondary AAA Tab \(Connection Profiles\), page 30-14](#).
- Step 6** (Remote access IPsec VPN only.) Click the **IPsec** tab to specify IPsec and IKE parameters for the connection profile. Some of these settings apply to IKEv1 but not to IKEv2 connections. For a detailed explanation of the configuration, see [IPsec Tab \(Connection Profiles\), page 30-16](#).

**Note**

To configure IKEv2 settings, use the IKEv2 Settings tab of the Global Settings policy; see [Configuring VPN Global IKEv2 Settings, page 25-34](#).

- Step 7** (Remote access SSL VPN only.) Click the **SSL** tab to specify the WINS servers for the connection profile policy, select a customized look and feel for the SSL VPN end-user logon web page, specify DHCP servers to be used for client address assignment, and establish an association between an interface and client IP address pools. For a detailed explanation of the configuration, see [SSL Tab \(Connection Profiles\), page 30-18](#).

**Step 8** Click **OK**.

---

## Connection Profiles Page

Use the Connection Profiles page to manage connection profile policies for remote access VPN or Easy VPN topologies. Use of this policy differs depending on the type of VPN you are configuring:

- Remote access SSL VPN—The policy is used only for ASA devices. You can create multiple profiles, and configure settings on all tabs of the Connection Profiles dialog box.
- Remote access IPsec VPN—The policy is used for ASA devices and PIX Firewalls running PIX 7.0+ software. You can create multiple profiles, but only the General, AAA, and IPsec tabs on the Connection Profiles dialog box apply to this configuration (in some cases, you will see only these tabs).
- Easy VPN topologies—The policy is used for Easy VPN servers (hubs) that are ASA devices or PIX Firewalls running PIX 7.0+ software. You can create a single profile, so the policy page actually imbeds the Connection Profiles dialog box, so that you have direct access to the tabs that define the profile. Only the General, AAA, and IPsec tabs apply.

For remote access IPsec and SSL VPNs:

- To add a profile, click the **Add Row** button and fill in the Connection Profiles dialog box.
- To edit an existing profile, select it and click the **Edit Row** button.
- To delete a profile, select it and click the **Delete Row** button.

The connection profile consists of the following tabs. Configure them as appropriate for the type of VPN you are configuring.

- [General Tab \(Connection Profiles\), page 30-9](#)
- [AAA Tab \(Connection Profiles\), page 30-11](#)
- [Secondary AAA Tab \(Connection Profiles\), page 30-14](#) (SSL VPN and IKEv2 IPsec VPN only.)
- [IPsec Tab \(Connection Profiles\), page 30-16](#) (IKEv1 IPsec VPN only, does not apply to SSL or IKEv2 IPsec VPNs.)
- [SSL Tab \(Connection Profiles\), page 30-18](#) (SSL VPN only)

### Navigation Path

Remote access VPNs:

- (Device View) Select a ASA or PIX 7+ device and select **Remote Access VPN > Connection Profiles** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Connection Profiles (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Easy VPN:

- From the [Site-to-Site VPN Manager Window, page 24-18](#), select the Easy VPN topology and then select **Connection Profiles (PIX7.0/ASA)**.
- (Device view) Select a device that participates in the Easy VPN topology and select **Site to Site VPN** from the Policy selector. Select the Easy VPN topology and click **Edit VPN Policies** to open the [Site-to-Site VPN Manager Window, page 24-18](#), where you can select the policy.

- (Policy view) Select **Site-to-Site VPN > Connection Profiles (PIX7.0/ASA)**. Select an existing policy or create a new one.

This section contains the following topics:

- [General Tab \(Connection Profiles\)](#), page 30-9
- [AAA Tab \(Connection Profiles\)](#), page 30-11
- [Secondary AAA Tab \(Connection Profiles\)](#), page 30-14
- [IPSec Tab \(Connection Profiles\)](#), page 30-16
- [SSL Tab \(Connection Profiles\)](#), page 30-18

## General Tab (Connection Profiles)

Use the General tab of the Connection Profiles dialog box to configure the basic properties for a VPN Connection Profile policy. These properties are used in remote access IPsec and SSL VPNs and site-to-site Easy VPN topologies.

### Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see [Connection Profiles Page, page 30-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **General** tab if necessary.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see [Connection Profiles Page, page 30-8](#)). Click the **General** tab if necessary.

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Client Address Assignment</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DHCP Servers                           | <p>The DHCP servers to be used for client address assignments. The servers are used in the order listed.</p> <p>Enter the IP addresses of the DHCP servers or the names of network/host policy objects that define the DHCP server addresses. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>                                                                                                                                                                                                                                                                                                                                      |
| Global IP Address Pool                 | <p>The address pools from which IP addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.</p> <p>Enter the address pool ranges or the names of network/host objects that define these pools. Click <b>Select</b> to select existing network/host objects or to create new ones. Separate multiple entries with commas.</p>                                                                 |
| Interface-Specific Address Pools table | <p>If you want to configure separate IP address pools for specific interfaces, so that clients connecting through that interface use a pool different from the global pool, add the interface to this table and configure the separate pool. Any interface not listed here uses the global pool.</p> <ul style="list-style-type: none"> <li>To add an interface-specific address pool, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Interface Specific Client Address Pools Dialog Box</a>, page 30-10</li> <li>To edit an interface pool, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface, select it and click the <b>Delete Row</b> button.</li> </ul> |

### Add/Edit Interface Specific Client Address Pools Dialog Box

Use the Add/Edit Interface Specific Client Address Pools dialog box to configure interface-specific client address pools for your connection profile policy.

#### Navigation Path

Open the General tab in the Connection Profiles dialog box (see [General Tab \(Connection Profiles\)](#), page 30-9), then click **Add Row** below the Interface-Specific Address Pools table, or select a row in the table and click **Edit Row**.

**Field Reference****Table 30-3 Add/Edit Interface Specific Client Address Pools Dialog Box**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | The interface to which you are assigning an address pool. Enter the interface name or the name of an interface role object, or click <b>Select</b> to select an interface or object or to create a new object.                                                                                                                                                     |
| Address Pool | The address pool to assign to the interface. Address pools are specified using the starting and ending IP addresses of the pool, for example, 10.100.10.2-10.100.10.254. You can either type in the IP address range, or use a network/host object that specifies an address range. Click <b>Select</b> to select a network/host object or to create a new object. |

**AAA Tab (Connection Profiles)**

Use the AAA tab of the Connection Profile dialog box to configure the AAA authentication parameters for a connection profile policy.

**Navigation Path**

- Remote Access VPNs—From the Connection Profiles page (see [Connection Profiles Page, page 30-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **AAA** tab.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see [Connection Profiles Page, page 30-8](#)). Click the **AAA** tab.

| Authentication Server Group                               | <p>The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>If you want to use different authentication server groups based on the interface to which the client connects, configure the server groups in the Interface-Specific Authentication Server Groups table at the bottom of this tab (described below).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Use LOCAL if Server Group Fails                           | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authorization Server Group                                | The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Users must exist in the authorization database to connect | Whether to require that the username of the client must exist in the authorization database to allow a successful connection. If the username does not exist in the authorization database, then the connection is denied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Accounting Server Group                                   | The name of the accounting server group. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Strip Realm from Username<br>Strip Group from Username    | <p>Whether to remove the realm or group name from the username before passing the username on to the AAA server. A realm is an administrative domain. Enabling these options allows the authentication to be based on the username alone.</p> <p>You can enable any combination of these options. However, you must select both check boxes if your server cannot parse delimiters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Override Account-Disabled Indication from AAA Server      | <p>Whether to override the “account-disabled” indicator from a AAA server. This configuration is valid for servers, such as RADIUS with NT LDAP, and Kerberos, that return an “account-disabled” indication.</p> <p>If you are using an LDAP directory server for authentication, password management is supported with the Sun Microsystems JAVA System Directory Server (formerly named the Sun ONE Directory Server) and the Microsoft Active Directory.</p> <ul style="list-style-type: none"> <li>• <b>Sun</b>—The DN configured on the security appliance to access a Sun directory server must be able to access the default password policy on that server. We recommend using the directory administrator, or a user with directory administrator privileges, as the DN. Alternatively, you can place an ACI on the default password policy.</li> <li>• <b>Microsoft</b>—You must configure LDAP over SSL to enable password management with Microsoft Active Directory.</li> </ul> |

| Element                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Notification Upon Password Expiration to Allow User to Change Password | Whether to have the security appliance notify the remote user at login that the current password is about to expire or has expired, and to then offer the user the opportunity to change the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Notification Prior to Expiration                                       | If you want to give the user prior warning of an impending password expiration, select <b>Enable Notification Prior to Expiration</b> and specify the number of days prior to expiration that you want to start notifications (1 to 180 days). You can use this option with AAA servers that support such notification—RADIUS, RADIUS with an NT server, and LDAP servers. There is no prior notification for other types of servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Notify Prior to Expiration                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Distinguished Name (DN) Authorization Settings                                | How you want to use the distinguished name for authorization. A distinguished name (DN) is a unique identification, made up of individual fields, that can be used as the identifier when matching users to a tunnel group. DN rules are used for enhanced certificate authentication. Select from the following options to determine how the DN is used during authorization: <ul style="list-style-type: none"> <li>• <b>Use Entire DN as the Username</b>—Use the entire DN; do not focus on any one field.</li> <li>• <b>Specify Individual DN fields as the Username</b>—Focus on specific fields. Select a primary field, and optionally, a secondary field. The default is to use the common name (CN) as primary and the organization unit (OU) as secondary.</li> </ul>                                                                                                                                                     |
| Interface-Specific Authentication Server Groups table                         | If you want to configure separate authentication server groups for specific interfaces, so that clients connecting through that interface use a server group different from the global group, add the interface to this table and configure the separate group. Any interface not listed here uses the global authentication server group. The table shows the server group and whether you are falling back to local authentication if the server group is not available. <ul style="list-style-type: none"> <li>• To add an interface-specific authentication group to the list, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Interface Specific Authentication Server Groups Dialog Box</a>, page 30-13.</li> <li>• To edit an interface setting, select it and click the <b>Edit Row</b> button.</li> <li>• To delete an interface setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

### Add/Edit Interface Specific Authentication Server Groups Dialog Box

Use the Add/Edit Interface Specific Authentication Server Groups dialog boxes to configure interface-specific authentication for your connection profile policy. This setting overrides the global authentication server group settings if the client connects to the specified interface.

If you are configuring the secondary AAA server for an SSL VPN on an ASA device, the settings are specifically used for the secondary set of credentials that the user enters; this is reflected in the name of the dialog box.

**Navigation Path**

Open the AAA or Secondary AAA tabs in the Connection Profiles dialog box (see [AAA Tab \(Connection Profiles\)](#), page 30-11 or [Secondary AAA Tab \(Connection Profiles\)](#), page 30-14), then click **Add Row** below the Interface-Specific Address Pools table, or select a row in the table and click **Edit Row**.

| Interface                                                                                                       | The name of the interface or interface role (that identifies the interfaces) for which you are configuring an authentication server group. Click <b>Select</b> to select an interface or interface role or to create a new interface role.                                                                                                                                                                                  |
| Server Group                                                                                                    | The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.<br><br>When you are configuring secondary AAA, this group is used specifically for the second credentials. You can specify different server groups for primary and secondary credentials. |
| Use LOCAL if Server Group Fails                                                                                 | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                                                                                                                                                                                                            |
| Use Primary Username<br>(Secondary authentication only; remote access SSL or IKEv2 IPsec VPN on ASA 8.2+ only.) | Whether to use the same username for the secondary credentials that was used for the primary credentials. If you select this option, after users authenticate with their primary credentials, they are prompted for the secondary password only. If you do not select this option, the secondary prompt requires both a username and password.                                                                              |

**Secondary AAA Tab (Connection Profiles)**

Use the Secondary AAA tab to configure the secondary AAA authentication parameters for a remote access SSL VPN connection profile policy for use with ASA 8.2+ devices, or a remote access IKEv2 IPsec VPN connection profile policy for use with an ASA 8.4(1)+ device. These settings do not apply to remote access IKEv1 IPsec VPNs or Easy VPN topologies or to other device types.

**Navigation Path**

Remote Access VPNs only—From the Connection Profiles page (see [Connection Profiles Page](#), page 30-8), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **Secondary AAA** tab.

Table 30-6 Connection Profile Secondary AAA Tab

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Double Authentication                            | Whether to enable double authentication, which prompts the user for two sets of credentials (username and password) before completing the remote access VPN connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Secondary Authentication Server Group                   | The name of the authentication server group (LOCAL if the tunnel group is configured on the local device) to be used with the second set of credentials. Enter the name of a AAA server group object or click <b>Select</b> to select it from a list or to create a new object.<br><br>If you want to use different authentication server groups based on the interface to which the client connects, configure the server groups in the Secondary Interface-Specific Authentication Server Groups table at the bottom of this tab (described below).                                                                                                                                                                                         |
| Use LOCAL if Server Group Fails                         | Whether to fall back to the local database for authentication if the selected authentication server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Use Primary Username for Secondary Authentication       | Whether to use the same username for the secondary credentials that was used for the primary credentials. If you select this option, after users authenticate with their primary credentials, they are prompted for the secondary password only. If you do not select this option, the secondary prompt requires both a username and password.                                                                                                                                                                                                                                                                                                                                                                                                |
| Username for Session                                    | The username that the software will use for the user session, either the primary or secondary name. If you prompt for the primary name only, select primary.<br><br><b>Note</b> By default, if there is more than one username, AnyConnect remembers both usernames between sessions. In addition, the head-end device might offer a feature to allow for administrative control over whether the client remembers both or neither usernames.                                                                                                                                                                                                                                                                                                 |
| Authorization Authentication Server                     | The server to use for authorization, either the primary authentication server (defined on the AAA tab) or the secondary authentication server configured on this tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Distinguished Name (DN) Secondary Authorization Setting | How you want to use the distinguished name for authorization. A distinguished name (DN) is a unique identification, made up of individual fields, that can be used as the identifier when matching users to a tunnel group. DN rules are used for enhanced certificate authentication. Select from the following options to determine how the DN is used during authorization: <ul style="list-style-type: none"> <li>• <b>Use Entire DN as the Username</b>—Use the entire DN; do not focus on any one field.</li> <li>• <b>Specify Individual DN fields as the Username</b>—Focus on specific fields. Select a primary field, and optionally, a secondary field. The default is to use only the user identification (UID) field.</li> </ul> |

Table 30-6 Connection Profile Secondary AAA Tab (Continued)

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Secondary Interface-Specific Authentication Server Groups table | <p>If you want to configure separate secondary authentication server groups for specific interfaces, so that clients connecting through that interface use a server group different from the global group, add the interface to this table and configure the separate group. Any interface not listed here uses the global authentication server group. The table shows the server group and whether you are falling back to local authentication if the server group is not available.</p> <ul style="list-style-type: none"> <li>To add a secondary interface-specific authentication group to the list, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Interface Specific Authentication Server Groups Dialog Box</a>, page 30-13.</li> <li>To edit an interface setting, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

## IPSec Tab (Connection Profiles)

Use the IPsec tab of the Connection Profiles page to specify IPsec and IKE parameters for the connection policy. The preshared key, trustpoint, and client software table apply to IKE version 1 only and do not apply to IKE version 2 (IKEv2).

### Note

To configure IKEv2 settings, use the IKEv2 Settings tab of the Global Settings policy; see [Configuring VPN Global IKEv2 Settings](#), page 25-34.

### Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see [Connection Profiles Page](#), page 30-8), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **IPSec** tab.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see [Connection Profiles Page](#), page 30-8). Click the **IPSec** tab.

| Preshared Key<br>(IKEv1 only.)                    | <p>The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field.</p> <p><b>Tip</b> You cannot configure preshared keys for IKEv2 remote access VPNs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Trustpoint Name<br>(IKEv1 only.)                  | <p>The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv1 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate.</p> <p>Click <b>Select</b> to select the object from a list or to create a new object.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>If you specify a trustpoint, you must also select the same PKI enrollment object in the Public Key Infrastructure policy. For more information, see <a href="#">Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52</a>.</li> <li>For IKEv2, you configure the trustpoint on the IKEv2 Settings tab of the Global Settings policy; see <a href="#">Configuring VPN Global IKEv2 Settings, page 25-34</a>.</li> </ul> |
| IKE Peer ID Validation                            | Select whether IKE peer ID validation is ignored (Do not check), required, or checked only if supported by a certificate. During IKE negotiations, peers must identify themselves to one another.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Sending Certificate Chain                  | Whether to enable the sending of the certificate chain for authorization. A certificate chain includes the root CA certificate, identity certificate, and key pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Password Update with RADIUS Authentication | Whether to enable passwords to be updated with the RADIUS authentication protocol. For more information, see <a href="#">Supported AAA Server Types, page 6-25</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ISAKMP Keepalive                                  | <p>Whether to monitor ISAKMP keepalive. If you select the <b>Monitor Keepalive</b> option, you can configure IKE keepalive as the default failover and routing mechanism. Enter the following parameters:</p> <ul style="list-style-type: none"> <li><b>Confidence Interval</b>—The number of seconds that a device waits between sending IKE keepalive packets.</li> <li><b>Retry Interval</b>—The number of seconds a device waits between attempts to establish an IKE connection with the remote peer. The default is 2 seconds.</li> </ul> <p>For more information, see <a href="#">Configuring VPN Global ISAKMP/IPsec Settings, page 25-30</a>.</p>                                                                                                                                                                                                                                                                                                 |

**Table 30-7** Connection Profiles IPsec Tab (Continued)

| Element                                    | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client Software Update table (IKEv1 only.) | <p>The VPN client revision level and URLs for client platforms. You can configure different revision levels for All Windows Platforms, Windows 95/98/ME, Windows NT4.0/2000/XP, or the VPN3002 Hardware Client.</p> <p>To configure the client for a platform, select it, click the <b>Edit Row</b> button, and fill in the <a href="#">IPSec Client Software Update Dialog Box, page 30-18</a>.</p> |

### IPSec Client Software Update Dialog Box

Use the IPsec Client Software Update dialog box to configure the specific revision level and image URL of a VPN client.

#### Navigation Path

Open the IPsec tab in the Connection Profiles dialog box (see [IPsec Tab \(Connection Profiles\), page 30-16](#)), select a client type from the Client Software Update table, then click **Edit Row**.

#### Field Reference

**Table 30-8** IPsec Client Software Update Dialog Box

| Element          | Description                       |
|------------------|-----------------------------------|
| Client Type      | Type of client being modified.    |
| Client Revisions | Revision level of the client.     |
| Image URL        | URL of the client software image. |

### SSL Tab (Connection Profiles)

Use the SSL tab of the Connection Profile dialog box to configure the WINS servers for the connection profile policy, select a customized look and feel for the SSL VPN end-user logon web page, DHCP servers to be used for client address assignment, and to establish an association between an interface and client IP address pools. Some items, such as connection profile aliases, apply to remote access IKEv2 IPsec VPNs, but otherwise these settings do not apply to remote access IKEv1 IPsec VPNs or Easy VPN topologies.

#### Navigation Path

Remote Access VPNs only—From the Connection Profiles page (see [Connection Profiles Page, page 30-8](#)), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **SSL** tab.

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WINS Servers List         | <p>The name of the WINS (Windows Internet Naming Server) servers list to use for CIFS name resolution. Click <b>Select</b> to select the WINS servers list policy object or to create a new object.</p> <p>SSL VPN uses the CIFS protocol to access or share files on remote systems. When you attempt a file-sharing connection to a Windows computer by using its computer name, the file server you specify corresponds to a specific WINS server name that identifies a resource on the network.</p> <p>A WINS servers list defines a list of WINS servers, which are used to translate Windows file server names to IP addresses. The security appliance queries the WINS servers to map WINS names to IP addresses. You must configure at least one, and up to three WINS servers for redundancy. The security appliance uses the first server on the list for WINS/CIFS name resolution. If the query fails, it uses the next server.</p> |
| DNS Group                 | <p>The DNS group to use for the SSL VPN tunnel group. The DNS group resolves the hostname to the appropriate DNS server for the tunnel group. Select the desired group from the list; the DefaultDNS group is the default group that is always available on the device.</p> <p><b>Tip</b> The DNS groups are defined in the <b>Platform &gt; Device Admin &gt; Server Access &gt; DNS</b> policy. Use the DNS policy to change the servers defined in a group or to add or remove groups. See <a href="#">DNS Page, page 51-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| Portal Page Customization | <p>The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. This profile defines the appearance of the portal page that allows the remote user access to all resources available on the SSL VPN. Click <b>Select</b> to select the object or to create a new object.</p> <p><b>Note</b> You can set up different login windows for different groups by using a combination of customization profiles and groups. For example, assuming that you had created a customization profile called salesgui, you can create an SSL VPN group called sales that uses that customization profile. You would then specify the SSL VPN customization object in the group policy object on the SSL VPN &gt; Settings tab; see <a href="#">ASA Group Policies SSL VPN Settings, page 33-17</a>.</p>                                                                                                               |
| Override SVC Download     | <p>Whether you want clientless users logging in under specific tunnel groups to not have to wait for the download prompt to expire before being presented with the clientless SSL VPN home page. Instead, these users are immediately presented with the clientless SSL VPN home page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 30-9 Connection Profile SSL Tab (Continued)**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reject Radius Message    | Whether you want to display to remote users a RADIUS message about their authentication failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Connection Aliases table | <p>A list of alternate names by which the tunnel group can be referred to. The status indicates whether the name is enabled for use or disabled (cannot be used).</p> <p>A group alias creates one or more alternate names by which a user can refer to a tunnel group. This feature is useful when the same group is known by several common names (such as “Devtest” and “QA”). If you want the actual name of the tunnel group to appear on this list, you must specify it as an alias. The group alias that you specify here appears on the login page. Each tunnel group can have multiple aliases or no alias.</p> <ul style="list-style-type: none"> <li>To add an alias, click the <b>Add Row (+)</b> button beneath the table and fill in the <a href="#">Add/Edit Connection Alias Dialog Box, page 30-20</a>.</li> <li>To edit an alias, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>To delete an alias, select it and click the <b>Delete Row (trash can)</b> button.</li> </ul> |
| Group URLs table         | <p>A list of URLs associated with the tunnel group connection profile. The status indicates whether the URL is enabled for use. When enabled, the user can use the URL, which eliminates the need to select a group during login.</p> <p>You can configure multiple URLs (or no URLs) for a tunnel group. Each URL can be enabled or disabled individually. You must use a separate specification for each URL, specifying the entire URL using either the HTTP or HTTPS protocol.</p> <ul style="list-style-type: none"> <li>To add a URL, click the <b>Add Row (+)</b> button beneath the table and fill in the <a href="#">Add/Edit Connection URL Dialog Box, page 30-21</a>.</li> <li>To edit a URL, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>To delete a URL, select it and click the <b>Delete Row (trash can)</b> button.</li> </ul>                                                                                                                                              |
| Disable CSD              | Whether to disable Cisco Secure Desktop (CSD) for this connection profile. In many cases, this option is disabled. Configure CSD in the Dynamic Access policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Add/Edit Connection Alias Dialog Box

Use the Add/Edit Connection Alias dialog box to create or edit a connection alias for an SSL or IKEv2 IPsec VPN connection profile. Specifying the connection alias creates one or more alternate names by which the user can refer to a tunnel group.

#### Navigation Path

Open the SSL tab in the Connection Profiles dialog box (see [SSL Tab \(Connection Profiles\), page 30-18](#)), and click **Add Row** beneath the Connection Alias table, or select an alias from the table and click **Edit Row**.

**Field Reference****Table 30-10 Add/Edit Connection Alias Dialog Box**

| Element          | Description                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled          | Whether to enable the connection alias. You must enable the alias for users to use it.                                                     |
| Connection Alias | The alternative name for the connection profile.<br>The connection alias that you specify here appears in a list on the user's login page. |

**Add/Edit Connection URL Dialog Box**

Use this dialog box to specify incoming URLs for the tunnel group. If a connection URL is enabled in a tunnel group, when the user connects using that URL, the security appliance selects the associated tunnel group and presents the user with only the username and password fields in the login window.

**Tips**

- You can configure multiple URLs or addresses (or none) for a group. Each URL or address can be enabled or disabled individually.
- You cannot associate the same URL or address with multiple groups. The security appliance verifies the uniqueness of the URL or address before accepting the URL or address for a tunnel group.

**Navigation Path**

Open the SSL tab in the Connection Profiles dialog box (see [SSL Tab \(Connection Profiles\)](#), page 30-18), and click **Add Row** beneath the Group URLs table, or select a URL from the table and click **Edit Row**.

**Field Reference****Table 30-11 Add/Edit Connection URL Dialog Box**

| Element        | Description                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| Enabled        | Whether to enable the connection alias. You must enable the alias for users to use it.                            |
| Connection URL | Select a protocol ( <b>http</b> or <b>https</b> ) from the list, and specify the incoming URL for the connection. |

## Configuring Group Policies for Remote Access VPNs

In the Group Policies page, you can view the user group policies defined for your ASA remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For information on creating connection profiles, see [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 30-6.

For more information about group policies, see [Understanding Group Policies \(ASA\)](#), page 30-22.

**Tip**

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

Each row in the table represents an ASA group policy object, displaying the name of the policy object assigned to the remote access VPN connection profile, whether it is stored on the ASA device itself (Internal) or on a AAA server (External), and whether the group is for IKEv1 (IPsec), IKEv2 (IPsec), SSL, or all types of VPN. For external groups, the protocol is unknown and listed as N/A.

- To add an ASA group policy object, click the **Add Row** button. This opens an object selector, from which you can select an existing policy object or click the **Create** button to create a new object. For more information about creating group policies, see [Creating Group Policies \(ASA, PIX 7.0+\)](#), page 30-23.

**Note**

You cannot create more than one group policy that includes DfltGrpPolicy in its name. DfltGrpPolicy is the default policy defined on the device; if Security Manager discovers the group during remote access policy discovery, the group appears in the list under the name `<device_display_name>DfltGrpPolicy`. When you deploy the configuration to the device, the display name prefix is removed so that DfltGrpPolicy is updated correctly. For more information, see [Discovering Remote Access VPN Policies](#), page 29-12.

- To edit an object, select it and click the **Edit Row** button to open the [ASA Group Policies Dialog Box](#), page 33-1.
- To delete an object from the policy, select it and click the **Delete Row** button. The associated policy objects are not deleted, they are only removed from this policy.

**Note**

You cannot delete the default group policy.

#### Navigation Path

- (Device view) Select an ASA device, then select **Remote Access VPN > Group Policies** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Group Policies (ASA)** from the Policy selector. Select an existing policy or create a new one.

## Understanding Group Policies (ASA)

When you configure a remote access IPsec or SSL VPN connection, you must create user groups to which remote clients will belong. A user group policy is a set of user-oriented attribute/value pairs for remote access VPN connections that are stored either internally (locally) on the device or externally on an AAA server. The connection profile uses a user group policy that sets terms for user connections after the connection is established. Group policies let you apply whole sets of attributes to a user or a group of users, rather than having to specify each attribute individually for each user.

**Tip**

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

An ASA user group comprises the following attributes:

- Group policy source—Identifies whether the user group's attributes and values are stored internally (locally) on the security appliance or externally on an AAA server. If the user group is an external type, no other settings need to be configured for it. For more information, see [ASA Group Policies Dialog Box, page 33-1](#).
- Client Configuration settings, which specify the Cisco client parameters for the user group in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies Client Configuration Settings, page 33-4](#).
- Client Firewall Attributes, which configure the firewall settings for VPN clients in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies Client Firewall Attributes, page 33-5](#).
- Hardware Client Attributes, which configure the VPN 3002 Hardware Client settings in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies Hardware Client Attributes, page 33-7](#).
- IPsec settings, which specify tunneling protocols, filters, connection settings, and servers for the user group in an Easy VPN or remote access VPN. For more information, see [ASA Group Policies IPsec Settings, page 33-8](#).
- Clientless settings, which configure the Clientless mode of access to the corporate network in an SSL VPN, for the ASA user group. For more information, see [ASA Group Policies SSL VPN Clientless Settings, page 33-10](#).
- Full Client settings, which configure the Full Client mode of access to the corporate network in an SSL VPN, for the ASA user group. For more information, see [ASA Group Policies SSL VPN Full Client Settings, page 33-13](#).
- General settings that are required for Clientless/Port Forwarding in an SSL VPN. For more information, see [ASA Group Policies SSL VPN Settings, page 33-17](#).
- DNS/WINS settings that define the DNS and WINS servers and the domain name that should be pushed to remote clients associated with the ASA user group. For more information, see [ASA Group Policies DNS/WINS Settings, page 33-20](#).
- Split tunneling that lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. For more information, see [ASA Group Policies Split Tunneling Settings, page 33-21](#).
- Remote access or SSL VPN session connection settings for the ASA user group. For more information, see [ASA Group Policies Connection Settings, page 33-22](#).

- [Creating Group Policies \(ASA, PIX 7.0+\), page 30-23](#)
- [Configuring Group Policies for Remote Access VPNs, page 30-21](#)

## Creating Group Policies (ASA, PIX 7.0+)

Use the Group Policies page to create group policies for ASA or PIX 7.0+ devices used in remote access IPsec VPNs, or ASA devices used in remote access SSL VPNs. For information about group policies, see:

- [Understanding Group Policies \(ASA\), page 30-22](#)
- [Configuring Group Policies for Remote Access VPNs, page 30-21](#)

- Step 1** Do one of the following:
- (Device view) With an ASA or PIX 7.0+ device selected, select **Remote Access VPN > Group Policies** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Group Policies (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- The Group Policies page opens. The table lists the existing group policies, whether they are defined internally on the device or externally on a AAA server, and the protocol for the group: IKEv1 (IPsec), IKEv2 (IPsec), or SSL.
- Step 2** Click **Add Row (+)** to open a dialog box from which you can select a user group from a list of predefined ASA user group objects, or create new ones if necessary. To create a new group, click the **Create (+)** button in the dialog box.
- Step 3** Select the required ASA user group from the list and click **OK**. If the required group already exists, you are finished.
- If the required ASA user group does not exist, create it by clicking **Create (+)**. The Add ASA User Group dialog box appears, displaying a list of settings that you can configure for the ASA user group object. For a description of the elements on this dialog box, see [ASA Group Policies Dialog Box, page 33-1](#).
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Select whether to store the ASA user group's attributes and values locally on the device, or on an external server.

**Note** If you selected to store the ASA user group's attributes on an external server, you do not need to configure any Technology settings. After you specify the AAA server group that will be used for authentication and a password to the AAA server, click **OK** and then select the group in the object selector and click **OK** to add it to the policy.

- Step 6** If you selected to store the ASA user group's attributes locally on the device, select the type of VPN for which you are creating the ASA user group from the **Technology** list:
- Easy VPN/IPSec IKEv1—For remote access IPsec VPNs that use IKE version 1 negotiations.
  - Easy VPN/IPSec IKEv2—(ASA only.) For remote access IPsec VPNs that use IKE version 2 negotiations.
  - SSL Clientless—(ASA only.) For SSL VPNs, all access modes (not just clientless).
- Step 7** To configure the user group for Easy VPN/IPSec IKEv1 and Easy VPN/IPSec IKEv2, from the Easy VPN/IPSec VPN folder in the Settings pane:
- a. Select **Client Configuration** to configure the Cisco client parameters. For a description of these settings, see [ASA Group Policies Client Configuration Settings, page 33-4](#).
  - b. Select **Client Firewall Attributes** to configure the firewall settings for VPN clients. For a description of these settings, see [ASA Group Policies Client Firewall Attributes, page 33-5](#).
  - c. Select **Hardware Client Attributes** to configure the VPN 3002 Hardware Client settings. For a description of these settings, see [ASA Group Policies Hardware Client Attributes, page 33-7](#).
  - d. Select **IPsec** to specify tunneling protocols, filters, connection settings, and servers. For a description of these settings, see [ASA Group Policies IPsec Settings, page 33-8](#).

- Step 8** To configure the user group for an SSL VPN, from the SSL VPN folder in the Settings pane:
- Select **Clientless** to configure the Clientless mode of access to the corporate network in an SSL VPN. For a description of these settings, see [ASA Group Policies SSL VPN Clientless Settings, page 33-10](#).
  - Select **Full Client** to configure the Full Client mode of access to the corporate network in an SSL VPN. For a description of these settings, see [ASA Group Policies SSL VPN Full Client Settings, page 33-13](#).
  - Select **Settings** to configure the general settings that are required for clientless and thin client (port forwarding) access modes in an SSL VPN. For a description of these settings, see [ASA Group Policies SSL VPN Settings, page 33-17](#).
- Step 9** Specify the following settings for an ASA user group in an Easy VPN/IPSec IKEv1 or IKEv2 VPN and SSL VPN configuration, in the Settings pane:
- Select **DNS/WINS** to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the ASA user group. For a description of these settings, see [ASA Group Policies DNS/WINS Settings, page 33-20](#).
  - Select **Split Tunneling** to allow a remote client to conditionally direct encrypted packets through a secure tunnel to the central site and simultaneously allow clear text tunnels to the Internet through a network interface. For a description of these settings, see [ASA Group Policies Split Tunneling Settings, page 33-21](#).
  - Select **Connection Settings** to configure the SSL VPN connection settings for the ASA user group, such as the session and idle timeouts, including the banner text. For a description of these settings, see [ASA Group Policies Connection Settings, page 33-22](#).
- Step 10** Click **OK**.
- Step 11** Select the ASA user group from the list and click **OK**.
- 

## Understanding SSL VPN Server Verification (ASA)

When connecting to a remote SSL-enabled server through clientless SSL VPN, it is important to know that you can trust the remote server, and that it is in fact the server you are trying to connect to. ASA 9.0 introduces support for SSL server certificate verification against a list of trusted certificate authority (CA) certificates for clientless SSL VPN.

When you connect to a remote server via a web browser using the HTTPS protocol, the server will provide a digital certificate signed by a CA to identify itself. Web browsers ship with a collection of CA certificates which are used to verify the validity of the server certificate. This is a form of public key infrastructure (PKI).

Just as browsers provide certificate management facilities, so does the ASA in the form of trusted certificate pool management facility: trustpools. This can be thought of as a special case of trustpoint representing multiple known CA certificates. The ASA includes a default bundle of certificates, similar to that provided with web browsers, but it is inactive until activated by the administrator.

### Note

If you are already familiar with trustpools from Cisco IOS then you should be aware that the ASA version is similar, but not identical.

---

For more information on managing trusted certificates, see the following topics:

- [Configuring SSL VPN Server Verification \(ASA\), page 30-61](#)
- [Configuring Trusted Pool Settings \(ASA\), page 30-26](#)
- [Using the Trustpool Manager, page 30-27](#)

## Configuring Trusted Pool Settings (ASA)

Use the Trusted Pool Settings page to configure options for certificate revocation. You can also launch the Trustpool Manager.

### Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > Trusted Pool** from the Policy selector.

### Related Topics

**Table 30-12 Trusted Pool Page (Continued)**

| Element                  | Description                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Launch Trustpool Manager | <p>Launches the Trustpool Manager, which is used to manage Trustpool certificates. You can use the Trustpool Manager to perform the following:</p> <p>For more information, see <a href="#">Using the Trustpool Manager, page 30-27</a>.</p> |

## Using the Trustpool Manager

Use the Trustpool Manager to manage the certificates that are included in the trustpool. The Trustpool Manager provides the following functions:

- Updating the trustpool
- Importing a certificate bundle
- Exporting a certificate bundle
- Removing certificates from the trustpool

### Navigation Path

(Device View only) Select an ASA device, select **Remote Access VPN > Trusted Pool** from the Policy selector, and then click **Launch Trustpool Manager**.

### Updating the Trustpool

The trustpool should be updated if either of the following conditions exists:

- Any certificate in the trustpool is due to expire or has been re-issued.
- The published CA certificate bundle contains additional certificates that are required by a specific application.

To update the certificates in the trustpool, click **Refresh Certificates**.

### Importing a Certificate Bundle

You can import individual certificates or bundles of certificates from a variety of locations in one of the following formats:

- x509 certificates in DER format wrapped in a pkcs7 structure
- a file of concatenated x509 certificates in PEM format (complete with PEM header)

To import a certificate or bundle:

1. Click **Import Bundle**.
2. Select the location of the bundle:
  - **Import from Cisco published signed root file distribution**—Select this option to import from the published distribution site.
  - **Import from a URL**—If the bundle is hosted on a server, select this option, select the protocol from the list, and enter the URL in the box.
  - **Bundle file on device**—If the bundle is stored on the ASA flash file system, select this option and then enter the path to the bundle.

- **Select bundle file**—If the bundle is stored on your machine, click Import from a file, then click Browse Local Files and navigate to the bundle.
  - **Import default bundle**—Select this option to import the default bundle.
3. Specify the following import options:
    - **Clear all certificates before import**—Whether to clear the trustpool before importing the bundle.
    - **Continue to import the bundle if signature validation fails or can't be performed**—Whether to continue import if the signature can not be validated.
  4. Click **Import**.

### Exporting a Certificate Bundle

When you have correctly configured the Trustpool you should export the pool. This will enable you to restore the Trustpool to this point, for example if you wish to remove a certificate that was added to the trustpool after the export. You can export the pool to the Security Manager server file system or your local file system.

To export the certificate bundle:

1. Click **Export Bundle**.
2. Click **Browse**.
3. Select the tab that corresponds to the file system you want to export to (local machine or Security Manager server).
4. Navigate to the folder where you want to save the trustpool.
5. Enter a unique memorable name for the trustpool in the File name box.
6. Click **Save**.

### Removing Certificates from the Trustpool

You can remove certificates from the trustpool using the following methods:

- To remove an individual certificate, select the certificate and click **Delete**.
- To remove all certificates that are not part of the default bundle, click **Clear Trustpool**.

---

**Note** Before clearing the trustpool you should export the current trustpool so that you can restore your current settings if needed.

---

## Working with IPsec VPN Policies

Certain policies need to be configured for IPsec VPNs. The topics listed below explain these remote access IPsec VPN policies, with the exception of the IKE Proposal policy, which is explained in [Configuring an IKE Proposal, page 25-9](#).

This section contains the following topics:

- [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 30-29
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\)](#), page 30-33

## Configuring Certificate to Connection Profile Map Policies (ASA)

Certificate to connection profile map policies are used for enhanced certificate authentication on ASA devices in remote access IKEv1 IPsec VPNs. They are not used in remote access IKEv2 IPsec or SSL VPNs.

Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods.

To match user permission groups based on DN fields of the certificate, you define rules that specify the fields to match for a group and then enable each rule for that selected group. A connection profile must already exist in the configuration before you can create a rule for it.

This procedure describes how to configure a Certificate to Connection Profile Map policy for a remote client trying to connect to an ASA server device.

---

**Step 1** Do one of the following:

- (Device View) Select an ASA device; then select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Policies** from the Policy selector.
- (Policy View) Select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Policies** from the Policy Type selector. Select an existing policy or create a new one.

The Certificate to Connection Profile Map Policies page opens.

**Step 2** Select any, or all, of the following options to establish authentication and to determine to which connection profile (tunnel group) to map the client:

- **Use Configured Rules to Match a Certificate to a Group**—To use the rules defined in the Certificate to Connection Profile Maps > Rules policy. For information on configuring the rules, see [Configuring Certificate to Connection Profile Map Rules \(ASA\)](#), page 30-29.
  - **Use Certificate Organization Unit (OU) Field to Determine the Group**—To use the organizational unit (OU) field of the client certificate.
  - **Use IKE Identify to Determine the Group**—To use the IKE identity.
  - **Use Peer IP address to Determine the Group**—To use the peer's IP address.
- 

## Configuring Certificate to Connection Profile Map Rules (ASA)

If you configure certificate to connection profile maps, and select the option to **Use Configured Rules to Match a Certificate to a Group** (as explained in [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 30-29), you need to configure the rules required to match a user to a connection profile based on the user certificate.

To match user permission groups based on fields of the certificate, you define rules that specify the fields to match for a group and then enable each rule for that selected group. You must first define a connection profile (tunnel group) before you can create and map a rule to it.

This procedure describes how to configure the Certificate to Connection Profile Map rules and parameters for any remote client trying to connect to an ASA server device.

**Tip**

Certificate to connection profile map policies apply to remote access IKEv1 IPsec VPNs only. They do not apply to IKEv2 or SSL VPNs.

### Before You Begin

- Make sure the connection profiles for which you are creating mapping rules has been configured on the device. See [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 30-6.
- Make sure that you select **Use Configured Rules to Match a Certificate to a Group** in the Certificate to Connection Profile Maps Policies policy. See [Configuring Certificate to Connection Profile Map Policies \(ASA\)](#), page 30-29.

**Step 1** (Device view only) With an ASA device selected, select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector.

The Certificate to Connection Profile Map Rules page is displayed. The policy has two tables:

- **Maps table (upper table)**—The upper table lists all connection profiles for which you are defining certificate to connection map rules. Each row is a profile map, which includes the name of the connection profile that is being mapped, the priority of the map (lower numbers have higher priority), and the map name. You can configure more than one map for the same connection profile.
  - To configure rules for a map, select it and then use the rules table to create, edit, and delete the rules.
  - To add a map, click the **Add Row** button and fill in the [Map Rule Dialog Box \(Upper Table\)](#), page 30-31.
  - To edit map properties (not rules), select it and click the **Edit Row** button.
  - To delete an entire map, select it and click the **Delete Row** button.
- **Rules table (lower table)**—The rules for the map selected in the upper table. You must ensure that the map is actually selected in the upper table: the group title above the rules table should say “**Details for (Connection Profile Name)**.”

When you select a map, the table shows all rules configured for the map, including the field (subject or issuer), certificate component, matching operator, and the value that the rule is looking for. The remote user must match all configured rules in a map for the device to use the mapped connection profile.

- To add a rule, click the **Add Row** button and fill in the [Map Rule Dialog Box \(Lower Table\)](#), page 30-32.
- To edit a rule, select it and click the **Edit Row** button.
- To delete a rule, select it and click the **Delete Row** button.

**Step 2** To add a rule to a map:

- a. Select the map in the upper table.

If the map does not already exist, create it by clicking the **Add Row (+)** button beneath the upper table and fill in the Map Rule dialog box for creating maps. In the dialog box, you must select the connection profile for the map, assign a relative priority between 1 and 65535 (lower numbers have higher priority), and a unique map name.

- b. Ensure that the map is actually selected. Highlighting the map in the table is not sufficient. The heading above the lower table should be “**Details for (Connection Profile Name),**” and unless the map is new, the table should show some rules.
- c. To add a new certificate to connection profile matching rule that must be satisfied in order for a remote client to connect to the device using the profile in this map, click the **Add Row (+)** button beneath the lower table. This opens the Map Rule dialog box with different fields.

**Note** If you get the error message “Missing Settings, A value ID required for Mapping field, Please select a Mapping,” it means that you have not successfully selected a map in the upper table. Click on the desired map again.

- d. From the **Field** list, select whether the rule should examine the Subject or Issuer field of the client certificate.
- e. From the **Component** list, select the component of the client certificate to use for the matching rule.
- f. From the **Operator** field, select how the component should be compared to the Value field: Equals (exact match is required), Contains (the entire value must appear), Does Not Equal, Does Not Contain.
- g. In the **Value** field, specify the value to match, then click **OK** to save the rule.
- h. Add additional rules to the map as desired.

**Step 3** In the **Default Connection Profile** field, select the connection profile that should be used for users who do not meet any of the map rules.

## Map Rule Dialog Box (Upper Table)

Use the Map Rule dialog box, when opened for the maps table in the upper part of the Certificate to Connection Profile Maps > Rules policy, to configure maps for which you can then configure rules in the lower table of the Rules policy. For a detailed explanation of configuring these maps and their associated rules, see [Configuring Certificate to Connection Profile Map Rules \(ASA\)](#), page 30-29.

### Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > IPSec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector. Click the **Add Row** button beneath the upper table, or select a map in the upper table and click **Edit Row**.

|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Profile | Select the connection profile for which you are creating matching rules. Clients attempting to connect to this connection profile must satisfy the associated matching rule conditions to connect to the device. |

**Table 30-13** Map Rule Dialog Box (Upper Table) (Continued)

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority | The priority number of the matching rule, between 1 and 65535. A lower number has a higher priority. For example, a matching rule with a priority number of 2, has a higher priority than a matching rule with a priority number of 5.<br><br>If you create multiple maps, they are processed in priority order, and the first matching rule determines to which profile the user is mapped. |
| Map Name | The name of the connection profile map.                                                                                                                                                                                                                                                                                                                                                      |

## Map Rule Dialog Box (Lower Table)

Use the Map Rule dialog box, when opened for the rules table in the lower part of the Certificate to Connection Profile Maps > Rules policy, to configure rules for the map selected in the maps table (upper table of the Rules policy). For a detailed explanation of configuring these rules, see [Configuring Certificate to Connection Profile Map Rules \(ASA\)](#), page 30-29.

### Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > IPsec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector. Click the **Add Row** button beneath the lower table, or select a rule in the lower table and click **Edit Row**.

### Field Reference

**Table 30-14** Map Rule Dialog Box (Lower Table)

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Field     | Select the field for the matching rule according to the <b>Subject</b> or the <b>Issuer</b> of the client certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Component | Select the component of the client certificate to use for the matching rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Operator  | Select the operator for the matching rule as follows: <ul style="list-style-type: none"> <li>Equals—The certificate component must match the entered value. If they do not match exactly, the connection is denied.</li> <li>Contains—The certificate component must contain the entered value. If the component does not contain the value, the connection is denied.</li> <li>Does Not Equal—The certificate component <i>cannot</i> equal the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client county value equals US, then the connection is denied.</li> <li>Does Not Contain—The certificate component <i>cannot</i> contain the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client county value contains US, the connection is denied.</li> </ul> |
| Value     | The value of the matching rule. The value entered is associated with the selected component and operator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices)

This procedure describes how to create or edit an IPsec proposal for your remote access VPN server when the server is an ASA or PIX 7.0+ device. If you are configuring an IPsec proposal for IOS or PIX 6.3 devices, including Catalyst 6500/7600 devices, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 32-3

An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.

When configuring an IPsec proposal, you must define the external interface through which the remote access clients connect to the server, the IKE version to use during IKE negotiation, and the encryption and authentication algorithms that protect the data in the VPN tunnel. You can also enable reverse route injection and NAT traversal.

For more information on IPsec tunnel concepts, see [Understanding IPsec Proposals](#), page 25-17.

### Related Topics

- [Table Columns and Column Heading Features](#), page 1-46

- 
- Step 1** Do one of the following:
- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy Type selector. Select an existing policy or create a new one.
- The IPsec Proposal page opens and lists the configured proposals, including the VPN endpoint, IPsec transform set, and whether reverse route injection is configured for the proposal.
- Step 2** Do any of the following:
- To add a new IPsec proposal, click the **Add Row (+)** button and fill in the IPsec Proposal Editor dialog box. For detailed information on the available options, see [IPsec Proposal Editor \(ASA, PIX 7.0+ Devices\)](#), page 30-33.
  - To edit an existing proposal, select it and click the **Edit Row (pencil)** button.
  - To delete a proposal, select it and click the **Delete Row (trash can)** button.
- 

## IPsec Proposal Editor (ASA, PIX 7.0+ Devices)

Use the IPsec Proposal Editor to create or edit an IPsec proposal for an ASA or PIX 7.0+ device.

The elements in this dialog box differ according to the selected device. The table below describes the elements on the General tab in the IPsec Proposal Editor dialog box when an ASA or PIX 7.0+ device is selected.

### Note

For a description of the elements in the dialog box when a PIX 7.0+ or ASA device is selected is selected, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\)](#), page 32-4.

**Navigation Path**

- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy selector. Click the Add Row (+) or Edit Row (pencil) buttons.
- (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy Type selector. Select an existing policy or create a new one. Click the Add Row (+) or Edit Row (pencil) buttons.

| Enable Traffic Flow Confidentiality (TFC) Packets | <p>Enable dummy TFC packets that mask the traffic profile which traverses the tunnel.</p> <p><b>Note</b> You must have an IKEv2 IPsec proposal set on the Tunnel Policy (Crypto Map) Basic tab before enabling TFC. Traffic Flow Confidentiality is not available when IKEv1 is enabled.</p> <p>Use the Burst, Payload Size, and Timeout parameters to generate random length packets at random intervals across the specified SA.</p> |

## Working with SSL and IKEv2 IPsec VPN Policies

Certain policies need to be configured for SSL VPNs. These policies are also used with remote access IKEv2 IPsec VPNs. The topics listed below explain these remote access VPN policies.

This section contains the following topics:

- [Understanding SSL VPN Access Policies \(ASA\), page 30-36](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)
- [Configuring SSL VPN Shared Licenses \(ASA 8.2+\), page 30-62](#)

## Understanding SSL VPN Access Policies (ASA)

An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or AnyConnect Essentials Client.

For more information about the Anyconnect VPN Client, see [Understanding SSL VPN AnyConnect Client Settings, page 30-52](#). The remainder of this topic explains DTLS and AnyConnect Essentials in more detail.

### Datagram Transport Layer Security (DTLS)

Enabling Datagram Transport Layer Security (DTLS) allows the AnyConnect client establishing an SSL VPN connection to use two simultaneous tunnels—an SSL tunnel and a DTLS tunnel. Using DTLS avoids latency and bandwidth problems associated with SSL connections and improves the performance of real-time applications that are sensitive to packet delays. By default, DTLS is enabled when SSL VPN access is enabled on an interface. If you disable DTLS, SSL VPN connections connect with an SSL VPN tunnel only.

#### Note

In order for DTLS to fall back to a TLS connection, you must specify a fallback trustpoint. If you do not specify a fallback trustpoint and the DTLS connection experiences a problem, the connection terminates instead of falling back to the specified trustpoint.

### AnyConnect Essentials VPN Client

AnyConnect Essentials is a separately licensed VPN client for SSL or IKEv2 IPsec, entirely configured on the adaptive security appliance, that provides the full AnyConnect capability, with the following exceptions:

- No CSD (including HostScan/Vault/Cache Cleaner)
- No clientless SSL VPN
- Optional Windows Mobile Support

The AnyConnect Essentials client provides remote end users running Microsoft Windows Vista, Windows Mobile, Windows XP or Windows 2000, Linux, or Macintosh OS X, with the benefits of a Cisco VPN client. If this feature is disabled, the full AnyConnect VPN client is used. This feature is disabled by default.

#### Note

---

This license cannot be used at the same time as the shared license for SSL VPN.

---

This section contains the following topics:

- [SSL VPN Access Policy Page, page 30-37](#)
- [Configuring an Access Policy, page 30-40](#)

## SSL VPN Access Policy Page

Use the SSL VPN Access Policy page to configure access parameters for your remote access SSL or IKEv2 IPsec VPN. For more information about configuring an Access policy, see [Configuring an Access Policy, page 30-40](#).

#### Tip

---

Any trustpoints that you specify in this policy must also be selected in the **Public Key Infrastructure** policy. For more information, see [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52](#).

---

#### Navigation Path

- (Device View) Select **Remote Access VPN > SSL VPN > Access** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

| Access Interface Table | <p>The Access Interface table lists the interfaces that are configured for remote access SSL or IKEv2 IPsec VPN connections. The table displays the access settings for each interface: whether the interface is enabled to allow VPN access, whether DTLS is enabled, whether client certificates are required, and the trustpoints used by the interface.</p> <ul style="list-style-type: none"> <li>To configure access on an interface, click the <b>Add row (+)</b> button (see <a href="#">Access Interface Configuration Dialog Box</a>, page 30-40).</li> <li>To edit access settings for an interface, select the interface and click the <b>Edit Row (pencil)</b> button (see <a href="#">Access Interface Configuration Dialog Box</a>, page 30-40).</li> <li>To delete access settings for an interface, select the interface and click the <b>Delete Row (trash can)</b> button.</li> </ul> |
| Port Number            | <p>The port to use for VPN sessions. The default port is 443, for HTTPS traffic. If HTTP port redirection is enabled, the default HTTP port number is 80. To specify a non-default port, the range is 1024 through 65535.</p> <p>Enter the port number or the name of a port list object, or click <b>Select</b> to select a port list object or to create a new object.</p> <p><b>Note</b> If you change the port number, all current SSL VPN connections terminate (upon configuration deployment), and current users must reconnect.</p>                                                                                                                                                                                                                                                                                                                                                              |
| DTLS Port Number       | <p>The UDP port to use for DTLS connections. The default port is 443. For details about DTLS, see <a href="#">Understanding SSL VPN Access Policies (ASA)</a>, page 30-36.</p> <p>Enter the port number or the name of a port list object, or click <b>Select</b> to select a port list object or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Fallback Trustpoint    | <p>The trustpoint (Certificate Authority, or CA server) to use for interfaces that do not have an assigned trustpoint. Enter the name of a PKI enrollment object, or click <b>Select</b> to select the object from a list or to create a new object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 30-16** SSL VPN Access Policy Page (Continued)

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Idle Timeout                                    | <p>The amount of time, in seconds, that an SSL or IKEv2 IPsec VPN session can be idle before the security appliance terminates it.</p> <p>This value applies only if the Idle Timeout value in the group policy for the user is set to zero (0), which means there is no timeout value; otherwise the group policy Idle Timeout value takes precedence over the timeout you configure here. The minimum value you can enter is 60 seconds (1 minute). The default is 30 minutes (1800 seconds). The maximum is 24 hours (86400 seconds).</p> <p>We recommend that you set this attribute to a short time period. This is because a browser set to disable cookies (or one that prompts for cookies and then denies them) can result in a user not connecting but nevertheless appearing in the sessions database. If the Simultaneous Logins attribute for the group policy is set to one, the user cannot log back in because the database indicates that the maximum number of connections already exists. Setting a low idle timeout removes such phantom sessions quickly, and lets a user log in again.</p> |
| Max Session Limit                                       | <p>The maximum number of SSL or IKEv2 IPsec VPN sessions allowed. Be aware that the different ASA models have different maximum session limits:</p> <ul style="list-style-type: none"> <li>• ASA 5505—25.</li> <li>• ASA 5510—250.</li> <li>• ASA 5520—750.</li> <li>• ASA 5540—2500.</li> <li>• ASA 5550, 5585-X with SSP-10—5000.</li> <li>• ASA 5580, 5585-X (other models)—10,000.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Allow Users to Select Connection Profile in Portal Page | <p>Whether to present a list of configured connection profiles (tunnel groups) from which the user can select the appropriate profile when the user logs in (for example, in the SSL VPN portal page). If you do not select this option, the user cannot select a profile and must use the default profile for the connection.</p> <p><b>Tip</b> You must select this option for remote access IKEv2 IPsec VPNs. It is optional for SSL VPNs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable AnyConnect Access                                | <p>Whether to allow the user to use the AnyConnect VPN client to make an SSL or IKEv2 IPsec VPN connection. The option is selected by default. For details about AnyConnect VPN clients, see <a href="#">Understanding SSL VPN AnyConnect Client Settings</a>, page 30-52.</p> <p><b>Tip</b> You must select this option for remote access IKEv2 IPsec VPNs. For SSL VPN, select this option if you want to enable full client access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable AnyConnect Essentials                            | <p>Whether to enable the AnyConnect Essentials feature, which can be used with both SSL and IKEv2 IPsec VPNs. For details about AnyConnect Essentials VPN clients, see <a href="#">Understanding SSL VPN Access Policies (ASA)</a>, page 30-36.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Access Interface Configuration Dialog Box

Use the Access Interface Configuration dialog box to configure an interface on an ASA device for remote access SSL or IKEv2 IPsec VPN connections.

### Navigation Path

Open the SSL VPN Access policy (see [SSL VPN Access Policy Page, page 30-37](#)), then click **Add Row** below the interface table, or select a row in the table and click **Edit Row**.

**Table 30-17 Access Interface Configuration Dialog Box**

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Interface                        | The interface or interface role object on which you want to configure SSL or IKEv2 IPsec VPN access. Enter the name of the interface or interface role, or click <b>Select</b> to select one from a list or to create new interface role objects.                                                                                                 |
| Trustpoint<br>Load Balancing Trustpoint | The trustpoint (Certificate Authority, or CA server) to use for authenticating users on the interface. Enter the name of a PKI enrollment object, or click <b>Select</b> to select one or to create a new object.<br><br>If load balancing is configured, you can also select a separate PKI enrollment object for the load balancing trustpoint. |
| Allow Access                            | Select this option to enable VPN access via this interface. If the option is not selected, access is configured on the interface, but it is disabled.                                                                                                                                                                                             |
| Enable DTLS                             | When selected, enables Datagram Transport Layer Security (DTLS) on the interface and allows an AnyConnect VPN Client to establish an SSL VPN connection using two simultaneous tunnels—an SSL tunnel and a DTLS tunnel.                                                                                                                           |
| Check Client Certificate                | When selected, a valid digital certificate is required from the client for connection.                                                                                                                                                                                                                                                            |

## Configuring an Access Policy

This procedure describes how to configure an Access policy on an ASA device. Access policies are required for remote access SSL and IKEv2 IPsec VPN connections. For more information about access policies, see [Understanding SSL VPN Access Policies \(ASA\), page 30-36](#).

### Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Access page opens. For a description of the elements on this page, see [SSL VPN Access Policy Page, page 30-37](#).

- Step 2** In the interface table at the top of the policy, configure all of the interfaces on which you will allow remote access SSL or IKEv2 IPsec VPN connections:
- To add an interface, click the **Add Row (+)** button beneath the table and fill in the Add Access Interface Configuration dialog box. You must specify the interface name (or an interface role object that identifies the desired interfaces) and whether to allow access on the interface.  
  
You can also specify the PKI enrollment object that identifies the Certificate Authority (CA) server trustpoint for the interface (and a load balancing trustpoint if you use load balancing), whether to enable DTLS connections, and whether to require that the client have a valid certificate to complete a connection. For details about the options, see [Access Interface Configuration Dialog Box, page 30-40](#).
  - To edit the settings for an interface, select it and click the **Edit Row (pencil)** button.
  - To delete an interface, select it and click the **Delete Row** button. Keep in mind that you can edit the interface settings to disable access, so you should delete an interface only if you want to permanently remove it from VPN use.
- Step 3** Configure the remaining settings. The settings are described in detail in [SSL VPN Access Policy Page, page 30-37](#). The following are the settings that are of particular interest:
- **Fallback Trustpoint**—The Certificate Authority (CA) server trustpoint to use if an interface does not have a trustpoint configured in the table. Enter the name of a PKI enrollment object, or click **Select** to select one or to create a new object.
  - **Allow Users to Select Connection Profile in Portal Page**—If you have multiple tunnel groups, selecting this option allows the user to select the correct tunnel group during login. You must select this option for IKEv2 IPsec VPNs.
  - **Enable AnyConnect Access**—The AnyConnect VPN client is a full client; you must enable AnyConnect access if you want to allow full client access to the VPN. You must select this option for IKEv2 IPsec VPNs.  
  
For more information about AnyConnect, including AnyConnect Essentials, see [Understanding SSL VPN AnyConnect Client Settings, page 30-52](#).
  - **Enable AnyConnect Essentials**—Select this option if you are using AnyConnect Essentials clients, which you can use with remote access SSL or IKEv2 IPsec VPNs.
- Step 4** Any trustpoints that you specify in this policy must also be selected in the **Public Key Infrastructure** policy. For more information, see [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52](#).
- 

## Configuring Other SSL VPN Settings (ASA)

The SSL VPN Other Settings policy for ASA devices defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, AnyConnect client images and profiles, Kerberos Constrained Delegation, and some other advanced settings.

To configure the Other Settings policy, do one of the following:

- (Device View) Select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

You can then configure the settings on the following tabs:

- Performance tab—To configure caching to improve SSL VPN performance. See [Configuring SSL VPN Performance Settings \(ASA\)](#), page 30-42.
- Content Rewrite tab—To create rules that permit users to browse certain sites and applications without going through the security appliance itself. See [Configuring SSL VPN Content Rewrite Rules \(ASA\)](#), page 30-43.
- Encoding tab—To configure non-default encoding for web pages delivered from CIFS servers. Encoding is normally determined by the remote user's browser. See [Configuring SSL VPN Encoding Rules \(ASA\)](#), page 30-45.
- Proxy tab—To define HTTP or HTTPS proxy servers, if your network requires them, and proxy bypass rules. See [Configuring SSL VPN Proxies and Proxy Bypass \(ASA\)](#), page 30-47.
- Plug In tab—To define browser plug-ins, which are separate programs that a web browser invokes to perform a dedicated function. See [Configuring SSL VPN Browser Plug-ins \(ASA\)](#), page 30-50.
- Client Settings tab—To configure AnyConnect client images and profiles for downloading to clients. See the following topics:
  - [Understanding SSL VPN AnyConnect Client Settings](#), page 30-52
  - [Configuring SSL VPN AnyConnect Client Settings \(ASA\)](#), page 30-53
- Microsoft KCD Server—To configure Kerberos Constrained Delegation (KCD) for use with clientless SSL VPN connections. See the following topics:
  - [Understanding Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\)](#), page 30-56
  - [Configuring Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\)](#), page 30-58
- AnyConnect Custom Attributes tab—To configure AnyConnect custom attributes. See [Configuring AnyConnect Custom Attributes \(ASA\)](#), page 30-59.
- Advanced tab—To configure the memory, on-screen keyboard, and internal password features. See [Configuring SSL VPN Advanced Settings \(ASA\)](#), page 30-61.
- SSL Server Verification tab—To enable HTTPS server verification for clientless SSL VPN users. See [Configuring SSL VPN Server Verification \(ASA\)](#), page 30-61.

**Tip**

You must also configure a connection profile policy on the device. See [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 30-6.

## Configuring SSL VPN Performance Settings (ASA)

Caching enhances SSL VPN performance. It stores frequently reused objects in the system cache, which reduces the need to perform repeated rewriting and compressing of content. It reduces traffic between SSL VPN and both the remote servers and end-user browsers, with the result that many applications run much more efficiently.

This procedure describes how to enable caching on your ASA security appliance.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\)](#), page 30-41

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector. Click the **Performance** tab if it is not already selected.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one. Click the **Performance** tab if it is not already selected.

**Step 2** Select **Enable** to enable caching on the security appliance.

If you deselect this option, the cache settings configured on the security appliance do not take effect.

**Step 3** Configure the following options:

- **Minimum Object Size**—The minimum size of an HTTP object that can be stored in the cache on the security appliance, in kilobytes. The range is 0-10,000 KB. The default is 0 KB.
- **Maximum Object Size**—The maximum size of an HTTP object that can be stored in the cache on the security appliance, in kilobytes. The range is 0-10,000 KB. The default is 1000 KB. The maximum size must be larger than the minimum size.
- **Last Modified Factor**—An integer to set a revalidation policy for caching objects that have only the last-modified timestamp, and no other server-set expiration values. The range is 1-100. The default is 20.

The Expires response from the origin web server to the security appliance request, which indicates the time that the response expires, also affects caching. This response header indicates the time that the response becomes stale and should not be sent to the client without an up-to-date check (using a conditional GET operation).

The security appliance can also calculate an expiration time for each web object before it is written to disk. The algorithm to calculate an object's cache expiration date is as follows:

Expiration date = (Today's date - Object's last modified date) \* Freshness factor

After the expiration date has passed, the object is considered stale and subsequent requests causes a fresh retrieval of the content by the security appliance. Setting the last modified factor to zero is equivalent to forcing an immediate revalidation, while setting it to 100 results in the longest allowable time until revalidation.

- **Expiration Time**—The amount of time (in minutes) that the security appliance caches objects without revalidating them. The range is 0-900 minutes. The default is one minute.  
Revalidation consists of rejecting the objects from the origin server before serving the requested content to the client browser when the age of the cached object has exceeded its freshness lifetime. The age of a cached object is the time that the object has been stored in the security appliance's cache without the security appliance explicitly contacting the origin server to check if the object is still fresh.
- **Cache Static Content**—Whether to cache static content on the security appliance. Each web page can include static and dynamic objects. The security appliance caches individual static objects, such as image files (\*.gif, \*.jpeg), java applets (.js), and cascading style sheets (\*.css).

## Configuring SSL VPN Content Rewrite Rules (ASA)

SSL VPN processes application traffic through a content transformation/rewriting engine that includes advanced elements (such as, JavaScript, VBScript, Java, and multi-byte characters) to proxy HTTP traffic depending on whether the user is using an application within or independently of an SSL VPN device.

If you do not want some applications and web resources, such as public web sites, to go through the security appliance, you can create rewrite rules that permit users to browse certain sites and applications without going through the security appliance itself. This is similar to split tunneling in an IPsec VPN connection.

In the Content Rewrite tab of the SSL VPN Other Settings page, you can configure multiple content rewrite rules. The Content Rewrite tab lists all applications for which content rewrite is enabled or disabled.

**Tip**

The security appliance searches rewrite rules by order number, starting with the lowest, and applies the first rule that matches.

This procedure shows you how to create or edit content rewrite rules.

**Related Topics**

- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

**Step 1**

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

On the Other Settings page, click the **Content Rewrite** tab. The Content Rewrite tab displays all applications for which content rewrite is enabled or disabled.

The security appliance searches rewrite rules by order number, starting with the lowest, and applies the first rule that matches. The resource mask defines the application string to which the rule is matched.

If a rule does not have a number, it is evaluated after all of the numbered rules.

**Step 3**

Do any of the following:

- To add a rule, click the **Add Row** button beneath the table and fill in the Add Content Rewrite dialog box. The options are described in detail in [Add/Edit Content Rewrite Dialog Box, page 30-44](#).
- To edit a rule, select it, click the **Edit Row** button, and make your changes in the Edit Content Rewrite dialog box.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

**Add/Edit Content Rewrite Dialog Box**

Use the Add or Edit Content Rewrite dialog box to configure the rewriting engine that includes advanced elements such as JavaScript, VBScript, Java, and multi-byte characters to proxy HTTP traffic over a SSL VPN connection. For more information about content rewrite rules, see [Configuring SSL VPN Content Rewrite Rules \(ASA\), page 30-43](#).

**Navigation Path**

From the Content Rewrite tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button, or select a rule and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN Content Rewrite Rules \(ASA\), page 30-43](#).

**Related Topics**

**Field Reference****Table 30-18 Add or Edit Content Rewrite Dialog Box**

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable        | <p>When selected, enables content rewriting on the security appliance for the rewrite rule.</p> <p>Some applications do not require this processing, such as external public web sites. For these applications, you might choose to turn off content rewriting.</p>                                                                                                                                                                                                                     |
| Rule Number   | <p>The number for this rule. This number specifies the position of the rule in the list. Rules without a number are at the end of the list. The range is from 1 to 65534.</p> <p>Rules are processed from the lowest to the highest number, and the first match is applied to the traffic.</p>                                                                                                                                                                                          |
| Rule Name     | An alphanumeric string that describes the content rewrite rule. The maximum length is 128 characters.                                                                                                                                                                                                                                                                                                                                                                                   |
| Resource Mask | <p>The name of the application or resource to which the rule applies. The maximum length is 300 characters.</p> <p>You can use the following wildcards:</p> <ul style="list-style-type: none"> <li>• *—Matches everything. You cannot use this wildcard by itself. It must accompany an alphanumeric string.</li> <li>• ?—Matches any single character.</li> <li>• [!x-y]—Matches any character not in the sequence.</li> <li>• [x-y]—Matches any character in the sequence.</li> </ul> |

**Configuring SSL VPN Encoding Rules (ASA)**

Use the Encoding tab of the SSL VPN Other Settings page to specify the character set to encode in SSL VPN portal pages to be delivered to remote users. By default, the encoding type set on the remote browser determines the character set for SSL VPN portal pages, so you need to set the character encoding only if it is necessary to ensure proper encoding on the browser.

Character encoding is the pairing of raw data (such as 0's and 1's) with characters to represent the data. The language determines the character encoding method to use. Some languages use the same method, while others do not. Usually, the geographic region determines the default encoding method used by the browser, but the remote user can change this. The browser can also detect the encoding specified on the page, and render the document accordingly.

The encoding attribute lets you specify the value of the character encoding method in the SSL VPN portal page to ensure that the browser renders it properly, regardless of the region in which the user is using the browser, or any changes made to the browser.

The character encoding attribute is a global setting that, by default, all SSL VPN portal pages inherit. However, you can override the file-encoding attribute for Common Internet File System (CIFS) servers that use character encoding that differs from the value of the character-encoding attribute. You can use different file-encoding values for CIFS servers that require different character encodings.

The SSL VPN portal pages downloaded from the CIFS server to the SSL VPN user encode the value of the SSL VPN file-encoding attribute identifying the server, or if one does not, they inherit the value of the character encoding attribute. The remote user's browser maps this value to an entry in its character encoding set to determine the proper character set to use. The SSL VPN portal pages do not specify a value if SSL VPN configuration does not specify a file encoding entry for the CIFS server and the character encoding attribute is not set. The remote browser uses its own default encoding if the SSL VPN portal page does not specify the character encoding, or if it specifies a character encoding value that the browser does not support.

In the Encoding tab of the SSL VPN Global Settings page, you can view the currently configured character sets associated with the CIFS server to be encoded in the portal pages. From this tab, you can create or edit the character sets, as described in the following procedure.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Encoding** tab. The Encoding tab displays the default encoding and a list of CIFS servers for which encoding rules are configured.
- Step 3** From the **Global SSL VPN Encoding Type** list, select the attribute that determines the character encoding that all SSL VPN portal pages inherit, except for those from the CIFS servers listed in the table.

---

**Note** If you choose **none** or specify a value that the browser on the SSL VPN client does not support, the browser uses its own default encoding. The default global encoding is none.

---

You can select from the following encoding types:

- big5
- gb2312
- ibm-850
- iso-8859-1
- shift\_jis

---

**Note** If you are using Japanese Shift\_jis Character encoding, click **Do not specify** in the Font Family area of the associated Select Page Font pane to remove the font family.

---

- unicode
- windows-1252
- none

- Step 4** Do any of the following:
- To add a rule, click the **Add Row** button beneath the table and configure the following settings in the Add File Encoding dialog box:

- **CIFS Server IP, CIFS Server Host**—Select one of these options to specify the CIFS server either by IP address or hostname. If you select IP address, you can either enter the IP address or the name of a network/host object that specifies one or more individual IP addresses.  
  
If you specify a hostname, the security appliance retains the case you specify, although it ignores the case when matching the name to a server.
- **Encoding Type**—Select the encoding type. The options are the same as for the global setting described above.
- To edit a rule, select it, click the **Edit Row** button, and make your changes in the Edit File Encoding dialog box.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

## Configuring SSL VPN Proxies and Proxy Bypass (ASA)

Use the Proxy tab of the SSL VPN Other Settings page to configure the security appliance to terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers. On this tab, you can also configure the security appliance to perform minimal content rewriting and to specify the types of content to rewrite—external links, XML, or neither.

The security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers. These servers act as intermediaries between users and the Internet. Requiring all Internet access through a server you control provides another opportunity for filtering to assure secure Internet access and administrative control.

### Note

The HTTP/HTTPS proxy does not support connections to personal digital assistants.

You can specify a proxy auto-configuration (PAC) file to download from an HTTP proxy server; however, you cannot use proxy authentication when specifying the PAC file.

You can configure the security appliance to use proxy bypass when applications and web resources work better with the content rewriting this feature provides. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

You can configure multiple proxy bypass entries. The order in which you configure them is unimportant. The interface and path mask or interface and port uniquely identify a proxy bypass rule.

If you configure proxy bypass using ports rather than path masks, depending on your network configuration, you might need to change your firewall configuration to allow these ports access to the security appliance. Use path masks to avoid this restriction. Be aware, however, that path masks can change, so you might need to use multiple path mask statements to exhaust the possibilities.

This procedure shows you how to define proxies and proxy bypass rules for your SSL VPN.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.

- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Proxy** tab. The Proxy tab displays any currently defined proxies and proxy rules.
- Step 3** From the **Proxy Type** field, select the type of external proxy server to use for SSL VPN connections:
- **HTTP/HTTPS Proxy Server**—To specify proxy servers to handle HTTP or HTTPS requests.
  - **Proxy Using PAC**—To specify a proxy auto-configuration (PAC) file to download from an HTTP proxy server to the user's browser. Once downloaded, the PAC file uses a JavaScript function to identify a proxy for each URL.
- If you select this option, enter the URL for the PAC file in the **Specify Proxy Auto Config file URL** field. The URL must begin with **http://** or the security appliance will not use the PAC file.
- Step 4** If you select HTTP/HTTPS Proxy Server for the proxy type, configure the settings for the HTTP and HTTPS proxy servers. There are separate settings for the HTTP and HTTPS server, allowing you to use different servers, or to specify only one type of proxy. Configure the following options:
- **Enable HTTP Proxy Server, Enable HTTPS Proxy Server**—Select either or both of these options to configure the proxy server.
  - **HTTP Proxy Server, HTTPS Proxy Server**—Enter the IP address, or the name of a network/host object that contains the single proxy server's IP address, for each type of proxy server you are configuring. You can click **Select** to select the object from a list or to create a new object.
- The default ports are 80 for HTTP and 443 for HTTPS.
- **HTTP Proxy Port, HTTPS Proxy Port**—Enter the port on the proxy server to which HTTP or HTTPS requests will be forwarded. You can also enter the name of a port list object that defines the port, or click **Select** to select an object or to create a new one.
  - **Exception Address List**—A URL or a comma-delimited list of several URLs to exclude from those that should be sent to the HTTP or HTTPS proxy servers. The string does not have a character limit, but the entire command cannot exceed 512 characters. You can specify literal URLs or use the following wildcards:
    - \* to match any string, including slashes (/) and periods (.). You must accompany this wildcard with an alphanumeric string.
    - ? to match any single character, including slashes and periods.
    - [x-y] to match any single character in the range of x and y, where x represents one character and y represents another character in the ANSI character set.
    - [!x-y] to match any single character that is not in the range.
  - **Authentication User Name, Authentication Password, Confirm**—If the proxy server requires user authentication, enter a valid user name and password.
- Step 5** If necessary, configure proxy bypass rules in the Proxy Bypass table at the bottom of the tab. Proxy bypass rules specify the ASA interface, port, and target URL configured for proxy bypass. Do any of the following:
- To create a proxy bypass rule, click the **Add Row** button and fill in the Add Proxy Bypass dialog box. For specific information on the attributes of a proxy bypass rule, see [Add or Edit Proxy Bypass Dialog Box, page 30-49](#).
  - To edit a proxy bypass rule, select the rule and click the **Edit Row** button.
  - To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

**Tip**

If you configure proxy bypass rules, you must also configure the SSL VPN Access policy. For more information, see [Configuring an Access Policy, page 30-40](#).

## Add or Edit Proxy Bypass Dialog Box

Use the Add or Edit Proxy Bypass dialog box to set proxy bypass rules when the security appliance should perform little or no content rewriting.

### Navigation Path

From the Proxy tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button, or select a rule and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN Encoding Rules \(ASA\), page 30-45](#).

**Table 30-19** Add or Edit Proxy Bypass Dialog Box

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                        | The interface on the security appliance that is used for proxy bypass. Enter the name of the interface or the interface role object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bypass On Port                   | Select this option to use a port number for proxy bypass. Valid port numbers are 20000-21000. Enter the ports or the name of a port list object, or click <b>Select</b> to select an object or to create a new one.<br><br><b>Note</b> If you configure proxy bypass using ports rather than path masks, depending on your network configuration, you might need to change your firewall configuration to allow these ports access to the security appliance. Use path masks to avoid this restriction.                                                                                                                                                                                                                                                                                                                      |
| Bypass Matching Specific Pattern | Select this option to use a URL path mask to match for proxy bypass. A path is the text in a URL that follows the domain name. For example, in the URL <code>www.mycompany.com/hrbenefits</code> , <code>hrbenefits</code> is the path.<br><br>You can use the following wildcards: <ul style="list-style-type: none"> <li>• <code>*</code>—Matches everything. You cannot use this wildcard by itself. It must accompany an alphanumeric string.</li> <li>• <code>?</code>—Matches any single character.</li> <li>• <code>[x-y]</code>—Matches any character in the sequence.</li> <li>• <code>[!x-y]</code>—Matches any character not in the sequence.</li> </ul> The maximum is 128 bytes.<br><br><b>Note</b> Path masks can change, so you might need to use multiple path mask statements to exhaust the possibilities. |

**Table 30-19 Add or Edit Proxy Bypass Dialog Box (Continued)**

| Element          | Description                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URL              | Select the <b>http</b> or <b>https</b> protocol, then enter a URL to which you want to apply proxy bypass.<br><br>URLs used for proxy bypass allow a maximum of 128 bytes. The port for HTTP is 80 and for HTTPS it is 443, unless you specify another port. |
| Rewrite XML      | Whether to rewrite XML sites and applications to be bypassed by the security appliance.                                                                                                                                                                      |
| Rewrite Hostname | Whether to rewrite external links to be bypassed by the security appliance.                                                                                                                                                                                  |

## Configuring SSL VPN Browser Plug-ins (ASA)

A browser plug-in is a separate program that a web browser invokes to perform a dedicated function, such as connect a client to a server within the browser window. The security appliance lets you import plug-ins for download to remote browsers in clientless SSL VPN sessions.

Cisco redistributes the following open-source, Java-based components to be accessed as plug-ins for web browsers in Clientless SSL VPN sessions. Cisco tests the plug-ins it redistributes, and in some cases, tests the connectivity of plug-ins we cannot redistribute. These files are available in the \files\vm\repository folder in the product installation folder (usually C:\Program Files\CSCOpX) on the Security Manager server. The actual file names include release numbers:

- `rdp-plugin.jar`—The Remote Desktop Protocol plug-in lets the remote user connect to a computer running Microsoft Terminal Services. The web site containing the source of the redistributed plug-in is <http://properjavardp.sourceforge.net/>.
- `ssh-plugin.jar`—The Secure Shell-Telnet plug-in lets the remote user establish a Secure Shell or Telnet connection to a remote computer. The web site containing the source of the redistributed plug-in is <http://javassh.org/>.

**Note** The `ssh-plugin.jar` provides support for both SSH and Telnet protocols. The SSH client supports SSH Version 1.0.

- `vnc-plugin.jar`—The Virtual Network Computing plug-in lets the remote user use a monitor, keyboard, and mouse to view and control a computer with remote desktop sharing turned on. The web site containing the source of the redistributed plug-in is <http://www.tightvnc.com>.

**Note** Per the GNU General Public License (GPL), Cisco redistributes plug-ins without having made any changes to them. Per the GPL, Cisco cannot directly enhance these plug-ins.

The security appliance does the following when you install a plug-in onto the flash device:

- (Cisco-distributed plug-ins only) Unpacks the jar file specified in the URL.
- Writes the file to the `cisco-config/97/plugin` directory on the security appliance file system.
- Enables the plug-in for all future clientless SSL VPN sessions, and adds a main menu option and an option to the drop-down menu next to the Address field of the portal page.

When the user in a clientless SSL VPN session clicks the associated menu option on the portal page, the portal page displays a window to the interface and displays a help pane. The user can select the protocol displayed in the drop-down menu and enter the URL in the Address field to establish a connection.

**Note**

Some Java plug-ins might report a status of connected or online even when a session to the destination service is not set up. The open-source plug-in reports the status, not the security appliance.

In the Plug-in tab of the SSL VPN Global Settings page, you can view the currently configured browser plug-ins for clientless SSL VPN browser access. From this tab, you can create or edit the plug-in files, as described in the following procedure.

**Plug-in Requirements and Restrictions**

Clientless SSL VPN must be enabled on the security appliance to provide remote access to the plug-ins. The minimum access rights required for remote use belong to the guest privilege mode. The plug-ins automatically install or update the Java version required on the remote computer. A stateful failover does not retain sessions established using plug-ins. Users must reconnect following a failover.

Before installing a plug-in, prepare the security appliance as follows:

- Make sure clientless SSL VPN is enabled on an interface on the security appliance.
- Install an SSL certificate onto the security appliance interface to which remote users use a fully-qualified domain name (FQDN) to connect.

**Note**

Do not specify an IP address as the common name (CN) for the SSL certificate. The remote user attempts to use the FQDN to communicate with the security appliance. The remote PC must be able to use DNS or an entry in the System32\drivers\etc\hosts file to resolve the FQDN.

**Related Topics**

- [Understanding and Managing SSL VPN Support Files, page 29-5](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Plug-in** tab. The Plug-in tab lists all configured plug-ins, including the type of plug-in and the name of the File policy object that defines the actual plug-in file.
- Step 3** Do any of the following:
- To add a plug-in, click the **Add Row** button beneath the table and fill in the Add Plug-In Entry dialog box as follows:
    - **Plug-in**—Select the type of plug-in that you are adding:
    - Remote Desktop (RDP) or RDP2—For Remote Desktop Protocol services.
    - Secure Shell (SSH), Telnet—For Secure Shell and Telnet services.
    - VNC—For Virtual Network Computing services.

- Citrix (ICA)—For Citrix MetaFrame services.
  - Post—For post services.
  - **Plug-in File**—The name of the File policy object that defines the plug-in file. Enter the name of the File object or click **Select** to select an object or to create a new one. For more information on creating File Objects, see [Add and Edit File Object Dialog Boxes, page 33-25](#).
- To edit a plug-in, select it, click the **Edit Row** button, and make your changes in the Edit Plug-In Entry dialog box.
  - To delete a plug-in, select it and click the **Delete Row** button. You are asked to confirm the deletion.

## Understanding SSL VPN AnyConnect Client Settings

The Cisco AnyConnect VPN Client provides secure SSL and IKEv2 IPsec connections to the security appliance for remote users. The client gives remote users the benefits of an SSL or IKEv2 IPsec VPN client without the need for network administrators to install and configure clients on remote computers.

**Tip**

IKEv2 IPsec connections require AnyConnect 3.0 or higher clients.

Without a previously installed client, remote users enter the IP address in their browser of an interface configured to accept SSL or IKEv2 IPsec VPN connections. Unless the security appliance is configured to redirect http:// requests to https://, users must enter the URL in the form https://<address>.

After the user enters the URL, the browser connects to that interface and displays the login screen. If the user satisfies the login authentication, and the security appliance identifies the user as requiring the client, it downloads the client that matches the operating system of the remote computer. After downloading, the client installs and configures itself, establishes a secure connection and either remains or uninstalls itself (depending on the security appliance configuration) when the connection terminates.

In the case of a previously installed client, when the user authenticates, the security appliance examines the revision of the client and upgrades the client as necessary.

When the client negotiates a connection with the security appliance, it connects using Transport Layer Security (TLS), and optionally, Datagram Transport Layer Security (DTLS). DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.

The AnyConnect client can be downloaded from the security appliance, or it can be installed manually on the remote workstation by the system administrator. For more information about installing the client manually, see the *Cisco AnyConnect Secure Mobility Client Administrator Guide*. AnyConnect documentation is available at

[http://www.cisco.com/en/US/products/ps10884/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps10884/tsd_products_support_series_home.html). You can find general information about AnyConnect at <http://www.cisco.com/go/anyconnect>.

The security appliance downloads the client based on the group policy or username attributes of the user establishing the connection. You can configure the security appliance to automatically download the client, or you can configure it to prompt the remote user about whether to download the client. In the latter case, if the user does not respond, you can configure the security appliance to either download the client after a timeout period or present the login page.

### AnyConnect Client Profiles

An AnyConnect client profile is a group of configuration parameters, stored in an XML file, that the client uses to configure the connection entries that appear in the client user interface. These parameters (XML tags) include the names and addresses of host computers and settings to enable additional client features.

The AnyConnect client installation includes a profile template, named *AnyConnectProfile.tmpl*, that you can edit with a text editor and use as a basis to create other profile files. You can also set advanced parameters that are not available through the user interface. The installation also includes a complete XML schema file, named *AnyConnectProfile.xsd*.

You can add the profile to the Client Settings tab in the Other Settings policy to have it loaded onto the security appliance and subsequently downloaded to the client workstations based on group policies and username attributes.

## Cisco AnyConnect Profile Editor

You can configure a profile using the AnyConnect profile editor, a convenient GUI-based configuration tool launched from Cisco Security Manager. The AnyConnect software package for Windows, version 2.5 and later, includes the editor, which activates when you launch the editor from the Add/Edit AnyConnect Client Profile dialog box as long as you have added an appropriate AnyConnect package to the AnyConnect Client Image list.

### Note

The Cisco AnyConnect Profile Editor is an independent program. For information about configuring AnyConnect profiles, and what AnyConnect Profile Editor can do for you, see the materials available online at [http://www.cisco.com/en/US/products/ps10884/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps10884/products_installation_and_configuration_guides_list.html).

### Navigation Path

Open the [Add/Edit AnyConnect Client Profile dialog box](#), then click **Launch Editor** (you must first add an appropriate AnyConnect package to the AnyConnect Client Image list before accessing the Add/Edit AnyConnect Client Profile dialog box). The AnyConnect Profile Editor is displayed.

- [Understanding and Managing SSL VPN Support Files, page 29-5](#)

## Configuring SSL VPN AnyConnect Client Settings (ASA)

This procedure shows you how to define SSL and IKEv2 IPsec VPN client images and profiles. For a detailed explanation of AnyConnect images and profiles, see [Understanding SSL VPN AnyConnect Client Settings, page 30-52](#).

**Tip**

Ensure that you add AnyConnect images of the required releases. For example, if you are configuring an IKEv2 IPsec VPN, you must include an AnyConnect 3.0 or higher image. In general, the image versions must support the features you are deploying in the remote access VPN.

**Related Topics**

- [Understanding SSL VPN AnyConnect Client Settings, page 30-52](#)
- [Cisco AnyConnect Profile Editor, page 30-53](#)
- [Understanding and Managing SSL VPN Support Files, page 29-5](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

**Step 1**

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

On the Other Settings page, click the **Client Settings** tab. The tab has two tables listing the configured AnyConnect clients and profiles separately.

The AnyConnect images include an order number. The security appliance downloads portions of the AnyConnect images to the remote computer until it achieves a match with the operating system, starting with the highest order number. Therefore, you should give the highest number to the image used by the most commonly-encountered operating system.

Because mobile users have slower connection speeds, you should load the AnyConnect image for Windows Mobile at the top of the list. Alternatively, you can decrease the connection time by specifying the regular expression **Windows CE** to match the user agent on Windows Mobile devices. When the browser on the mobile device connects to the ASA, it includes the User-Agent string in the HTTP header. The ASA, receiving the string, immediately downloads AnyConnect for Windows Mobile without ascertaining whether the other AnyConnect images are appropriate.

**Step 3**

To add an AnyConnect client image or make changes to the existing list, do any of the following:

- To add an AnyConnect image, click the **Add Row** button beneath the table and fill in the Add AnyConnect Client Image dialog box. You need to specify the name of the File object that defines the image and the priority order of the image. You can also specify a regular expression for the connecting client to speed up the download. For detailed information about the options, see [Add/Edit AnyConnect Client Image Dialog Box, page 30-55](#).
- To edit an image, select it, click the **Edit Row** button, and make your modifications in the Edit AnyConnect Client Image dialog box.
- To delete an image, select it and click the **Delete Row** button. You are asked to confirm the deletion.

**Step 4**

To add an AnyConnect profile or make changes to the existing list, do any of the following:

- To add an AnyConnect profile, click the **Add Row** button beneath the table and configure these options in the Add AnyConnect Client Profile dialog box:
  - **AnyConnect Profile Name**—The name of the profile.

To use this profile, ensure that you specify the profile name in an ASA Group Policy object assigned to the security appliance (in the Full Client settings page as described in [ASA Group Policies SSL VPN Full Client Settings, page 33-13](#)). Configure the ASA Group Policy object through the remote access Connection Profiles policy for the device as described in [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 30-6](#).

- **AnyConnect Profile Type**—Select the type of AnyConnect Profile you are adding or editing: VPN, Network Access Manager, Telemetry, Web Security, or Customer Experience Feedback.
- **AnyConnect Profile File**—The name of the File object that identifies the Anyconnect client profile XML file. Click **Select** to select the object or to create a new one. For more information about File objects, see [Add and Edit File Object Dialog Boxes, page 33-25](#).

**Note** If you are going to create a new profile using the AnyConnect Profile Editor, do not specify an AnyConnect Profile File.

- **Launch Editor**—Click **Launch Editor** to use the AnyConnect Profile Editor to edit the profile specified in AnyConnect Profile File or to create a new profile if no profile file is specified. For more information about File objects, see [Cisco AnyConnect Profile Editor, page 30-53](#).
- To edit a profile, select it, click the **Edit Row** button, and make your modifications in the Edit AnyConnect Client Profile dialog box.
- To delete a profile, select it and click the **Delete Row** button. You are asked to confirm the deletion.

### Add/Edit AnyConnect Client Image Dialog Box

Use the Add or Edit AnyConnect Client Image dialog box to create or edit a package file as the client image, and establish the order that the security appliance downloads the image to the remote workstation.

#### Navigation Path

From the Client Settings tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the AnyConnect Client Image table, or select an image and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring SSL VPN AnyConnect Client Settings \(ASA\), page 30-53](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Image Order        | The order in which the security appliance downloads the client images to the remote workstation. It downloads the image in priority order. Therefore, you should enter a lower value for the image used by the most commonly-encountered operating system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Regular Expression | <p>A regular expression to match the user agent. Enter a name of an existing regular expression policy object or click <b>Select</b> to select or create a new one.</p> <p>If you are adding an AnyConnect package for Windows Mobile, specify the regular expression <b>Windows CE</b> to match the user agent on Windows Mobile devices. This decreases the connection time of the mobile device. When the browser on the mobile device connects to the adaptive security appliance, it includes the User-Agent string in the HTTP header. The adaptive security appliance, receiving the string, immediately downloads AnyConnect for Windows Mobile without ascertaining whether the other AnyConnect images are appropriate.</p> |

## Understanding Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)

There are many ways to protect network resources through the use of authentication. Many organizations want to use Kerberos to protect certain web applications while using other authentication techniques, such as username and password, digital certificates, RSA SecureID, or SmartCards, to control access to an SSL VPN. However, a restriction in the Kerberos protocol prevents Kerberos authentication if the user has already used another technique to authenticate to the VPN.

Microsoft overcomes this limitation in Kerberos starting with Windows Server 2003. Using protocol transition and constrained delegation, the ASA can authenticate to the Kerberos Key Distribution Center (KDC) on the Windows domain controller and obtain impersonate tickets for users who have authenticated to the ASA using non-Kerberos protocols. The ASA can use the impersonate ticket to obtain other Kerberos service tickets for remote users.

To configure the domain controller so that Kerberos constrained delegation works, you must do the following:

- Each instance of a service that uses Kerberos authentication must have a service principle name (SPN) defined so that clients can identify it on the network. Register the SPN in the Active Directory **Service-Principal-Name** attribute of the Windows account under which the instance of the service is running. When a service needs to authenticate to another service running on a specific computer, it uses that service's SPN to differentiate it from other services running on that computer.

The SPN syntax is *service\_class/host\_name:port*, where:

- *service\_class* identifies the service. It can be a built-in service, such as http, or a user defined service.
  - *host\_name* identifies the fully-qualified domain name or NetBIOS name of the server that hosts the service, but it cannot be an IP address.
  - *port* identifies the port on which the service runs. You can omit the port if you use the default service port.
- Create a service account username and password that the ASA can use. Configure the account to allow Kerberos constrained delegation to any authentication protocol. In addition, the user account must not be marked as a sensitive account that cannot be delegated.

To configure the ASA to allow KCD, once the ASA joins the domain, an entry should appear under the Users and Computers list on the domain controller for the ASA. In the Properties dialog box, on the Delegation tab, select **Trust this computer for delegation to specified services only**, and then select **Use any authentication protocol**. In the table of authorized services, add all services for which the ASA is delegated for authentication on behalf of users.

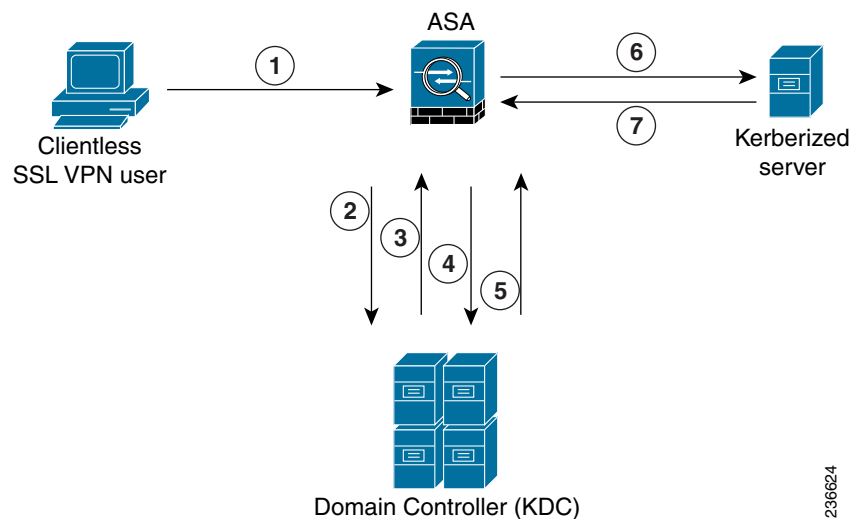

**Tip**

For definitive information on configuring this feature on the Windows domain controller, refer to the Microsoft documentation.

For the ASA to use Kerberos constrained delegation, you must configure the ASA as described in [Configuring Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\)](#), page 30-58. The feature is available on ASA Software release 8.4 and higher only.

Following is an example that explains how Kerberos constrained delegation works with a clientless SSL VPN hosted on an ASA.

**Figure 30-1 Kerberos Constrained Delegation Example**

After verifying the identity of an SSL VPN user with the configured authentication mechanism, the ASA uses protocol transition to switch to the Kerberos protocol for authentication on behalf of the user and then sends a Kerberos service ticket instead of the user's credentials to a published Web server that accepts Kerberos for authentication. Following are the steps:

1. An SSL VPN user session is authenticated by the ASA using the authentication mechanism configured for the user. For example, in case of Smartcard credentials, the ASA extracts the required information (the user's principle name) from the digital certificate and performs LDAP authorization against Windows Active Directory.
2. After successful authentication, the user logs into the ASA SSL VPN portal page. The VPN user accesses a web service by entering a URL in the portal page or by clicking on a bookmark. If the access requires authentication, the server challenges the ASA for credentials and along with the challenge sends a list of authentication mechanisms supported by the server. Based on the HTTP headers in the challenge, the ASA deduces whether the server requires Kerberos authentication. If connecting to a backend server requires Kerberos authentication, then the ASA requests an impersonate ticket, for itself on behalf the user, from the KDC.

- The KDC returns the requested tickets to the ASA. Even though these tickets are passed to the ASA, they contain the user's authorization data.

**Note** These first steps comprise protocol transition; after these steps, a user who authenticated to the ASA using a non-Kerberos authentication protocol is transparently authenticated to the KDC using Kerberos.

- The ASA now requests a service ticket from the KDC for the specific service that the user wants to access. The service ticket request contains the SPN (the unique identifier) of the service.
- The KDC returns a service ticket for the specific service to the ASA.
- The ASA uses the service ticket to request access to the web service, in the above scenario this is sent to the web server in a HTTP GET request.
- The web server authenticates the Kerberos service ticket and grants access to the service. An authentication failure will display an appropriate error message after acknowledgment of which the portal will be displayed.

## Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)

Use the Microsoft KCD Server tab of the SSL VPN Other Settings page to configure Kerberos Constrained Delegation (KCD) for clientless SSL VPNs hosted on an ASA.

KCD addresses a limitation of Kerberos. If a user authenticates to the SSL VPN using a method other than Kerberos, the user cannot access Kerberos-protected resources. This prevents a remote access device, such as ASA, from authenticating users using non-Kerberos methods and still provide single sign-on access to Kerberos-authenticated web applications in the enterprise.

If this limitation applies to your network, you can configure KCD to get around the limitation. KCD offloads the Kerberos authentication to the ASA. Users log into the corporate network using the SSL VPN portal, and from then on, access Kerberos-protected services in a transparent fashion.

### Tips

- KCD requires ASA release 8.4+. If you configure KCD for other releases, the configuration is ignored.
- The feature is used with clientless SSL VPN access only.
- Microsoft Windows Server (2003 or 2008), configured as domain controllers, are required for KCD.
- If you use SSL VPN Bookmark policy objects to define bookmarks to include on the SSL VPN portal page, you might need to add explicit service principle name (SPN) parameters to bookmarks if a service uses a non-default port. For services that use Kerberos authentication, an SPN must be defined in the Service-Principle-Name attribute of the account under which the service runs.

Bookmarks need to reflect this configuration. The SPN is a parameter on the URL:

`http://<url>?SPN=<spn>` or `http://<url>?SPN=<spn>`. For example,

**`http://owa.example.com?SPN=http/owa:444`**. For more details about the SPN syntax, see [Understanding Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\)](#), page 30-56.

- To configure this feature, you must also configure the Hostname, DNS, and NTP policies. Configure both hostname and domain name in the Hostname policy.

- Kerberos authentication requires that the clock between the hosts to be synchronized with a maximum drift of 5 minutes (this is the default setting). This restriction is applicable to the clocks on the ASA, the domain controller, and the application servers. Configuring the same NTP server for all servers should address the requirement.

#### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)
- [Understanding AAA Server and Server Group Objects, page 6-24](#)

---

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** On the Other Settings page, click the **Microsoft KCD Server** tab.

**Step 3** Select **Configure KCD** and configure the following options:

- **KCD Server**—The AAA server group object that identifies the Microsoft KCD server (the domain controller) to use for Kerberos Constrained Delegation. Enter the name of the object or click **Select** to select it from a list or to create a new object. The object must use a Kerberos AAA server policy object to identify the domain controller.
- **Username, Password, Confirm**—A user account that the ASA can use to join the Active Directory domain.

For the ASA to use Kerberos protocol transition and constrained delegation, and obtain service tickets on behalf of the remote access users, the account used by the ASA to authenticate with the domain controller must be configured in Active Directory and configured to allow Kerberos constrained delegation to any authentication protocol. In addition, the user account must not be marked as a sensitive account that cannot be delegated. For more information about Active Directory configuration requirements, see [Understanding Kerberos Constrained Delegation \(KCD\) for SSL VPN \(ASA\), page 30-56](#).

---

## Configuring AnyConnect Custom Attributes (ASA)

AnyConnect custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade.

In the AnyConnect Custom Attribute tab of the SSL VPN Other Settings page, you can view configured AnyConnect custom attributes, add new attributes, and modify or delete existing attributes.

#### Related Topics

- [Understanding and Managing SSL VPN Support Files, page 29-5](#)
- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

---

**Step 1** Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.

- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **AnyConnect Custom Attribute** tab. The AnyConnect Custom Attribute tab lists all defined custom attributes.
- Step 3** Do any of the following:
- To add a custom attribute, click the **Add Row** button beneath the table and fill in the Add AnyConnect Custom Attribute dialog box. The options are described in detail in [Add/Edit AnyConnect Custom Attribute Dialog Box, page 30-60](#).
  - To edit a custom attribute, select it, click the **Edit Row** button, and make your changes in the Edit Plug-In Entry dialog box.
  - To delete a custom attribute, select it and click the **Delete Row** button. You are asked to confirm the deletion.

### Add/Edit AnyConnect Custom Attribute Dialog Box

Use the Add or Edit AnyConnect Custom Attribute dialog box to add or modify an AnyConnect custom attribute. AnyConnect custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade.

#### Navigation Path

From the AnyConnect Custom Attribute tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the AnyConnect Custom Attributes table, or select an attribute and click the **Edit Row** button. For detailed information on opening the tab, see [Configuring AnyConnect Custom Attributes \(ASA\), page 30-59](#).

#### Field Reference

**Table 30-21 Add or Edit AnyConnect Custom Attributes Dialog Box**

| Element     | Description                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the AnyConnect custom attribute. This name is used when referencing the attribute in Security Manager and in the aggregate auth protocol messages sent to the AnyConnect client. The maximum length is 32 characters. |
| Description | A free form description of attribute usage. This text will appear in the command help when the custom attribute is referenced from the group-policy attribute configuration mode. The maximum length is 128 characters.           |

## Configuring SSL VPN Advanced Settings (ASA)

Use the Advanced tab of the SSL VPN Other Settings page to configure the memory, on-screen keyboard, and internal password features on ASA devices. All of these settings are optional.

### Related Topics

- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** On the Other Settings page, click the **Advanced** Tab.
- Step 3** In the **Memory Size** field, specify the amount of memory you want to allocate to SSL VPN sessions. The default is 50%.
- To change the setting, select one of the following options and enter the desired number:
- **% of Total Physical Memory**—As a percentage of total memory. Default is 50%.
  - **Kilobytes**—In kilobytes. 20KB is the minimum setting allowed. Cisco recommends that you do not specify memory in terms of KB because different ASA models have different total amounts of memory, for example:
-  **Note** When you change the memory size, the new setting takes effect only after the system reboots.
- 
- Step 4** In the **Enable On-Screen Keyboard** field, select one of the following options:
- **Disabled**—The on-screen keyboard is not displayed. Users must input their credentials using the standard keyboard. This is the default.
  - **On All Pages**—Allows a user to input credentials using an on-screen keyboard, which is displayed whenever logon credentials are required.
  - **On Logon Page Only**—Allows a user to input credentials using an on-screen keyboard, which is displayed on the logon page but not on any other pages that require credentials.
- Step 5** Select **Allow Users to Enter Internal Password** to require an additional password when accessing internal sites. This feature is useful if you require that the internal password be different from the SSL VPN password. For example, you can use a one-time password for authentication to ASA and another password for internal sites.
- 

## Configuring SSL VPN Server Verification (ASA)

When connecting to a remote SSL-enabled server through clientless SSL VPN, it is important to know that you can trust the remote server, and that it is in fact the server you are trying to connect to. ASA 9.0 introduces support for SSL server certificate verification against a list of trusted certificate authority (CA) certificates for clientless SSL VPN.

When you connect to a remote server via a web browser using the HTTPS protocol, the server will provide a digital certificate signed by a CA to identify itself. Web browsers ship with a collection of CA certificates which are used to verify the validity of the server certificate. This is a form of public key infrastructure (PKI).

Just as browsers provide certificate management facilities, so does the ASA in the form of trusted certificate pool management facility: trustpools. This can be thought of as a special case of trustpoint representing multiple known CA certificates. The ASA includes a default bundle of certificates, similar to that provided with web browsers, but it is inactive until activated by the administrator.

**Note**

If you are already familiar with trustpools from Cisco IOS then you should be aware that the ASA version is similar, but not identical.

This procedure describes how to enable HTTPS server verification for clientless SSL VPN users.

**Related Topics**

- [Configuring Other SSL VPN Settings \(ASA\), page 30-41](#)
- [Configuring Trusted Pool Settings \(ASA\), page 30-26](#)
- [Using the Trustpool Manager, page 30-27](#)

**Step 1**

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector. Click the **SSL Server Verification** tab.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one. Click the **SSL Server Verification** tab.

**Step 2**

Select **Enable** to enable HTTPS Server Verification for Clientless SSL VPN users.

**Step 3**

Specify the action you want to be taken if server certificate verification fails:

- **Disconnect user from Https page** – Disconnect if the server could not be verified.
- **Allow user to continue to Https page** – Allow the user to continue the connection, even if the check failed.

## Configuring SSL VPN Shared Licenses (ASA 8.2+)

Use the SSL VPN Shared License page to configure your SSL VPN Shared License.

You can purchase a shared license with a large number of SSL or remote access IKEv2 IPsec VPN sessions and share the sessions as needed among a group of ASA devices by configuring one of the ASA devices as a shared license server, and the rest as clients. For the server license, you can share 500-50,000 licenses in increments of 500 and 50,000-1,040,000 licenses in increments of 1000.

A license is consumed by each remote access user that makes an SSL or IKEv2 IPsec connection.

**Note**

The shared license cannot be used at the same time as the AnyConnect Essentials license.

The following topics explain the procedure for configuring shared licenses:

- [Configuring an ASA Device as a Shared License Client, page 30-64](#)
- [Configuring an ASA Device as a Shared License Server, page 30-65](#)

#### Navigation Path

- (Device View) Select an ASA device using version 8.2 or higher, and select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

#### Field Reference

**Table 30-22** *SSL VPN Shared License Page*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Role                  | The role you are configuring, either Shared License Client or Shared License Server. Depending on your choice, different fields appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Shared License Client</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Shared Secret                | The case-sensitive string (4-128 characters) used for communicating with the shared license server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| License Server               | The IP address or the name of a network/host object that identifies the ASA device configured as the license server. Click <b>Select</b> to select an existing object or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| License Server Port          | The number of the TCP port on which the license server communicates. Enter a port number or the name of a port list object, or click <b>Select</b> to select an object or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Select Backup Role of Client | The backup role of the client: <ul style="list-style-type: none"> <li>• <b>Client Only</b>—When selected, the client acts only as the client. In this case, you can specify another device as a backup server. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new object.</li> <li>• <b>Backup Server</b>—When selected, the client also acts as the backup server. In this case, you must also specify the interfaces to be used for this purpose. Enter a comma-separated list of interface names or interface role objects, or click <b>Select</b> to select interfaces or objects or to create new objects.</li> </ul> |
| <b>Shared License Server</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Shared Secret                | The case-sensitive string (4-128 characters) used for communicating with the shared license server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| License Server Port          | The number of the TCP port on which the license server communicates. Enter a port number or the name of a port list object, or click <b>Select</b> to select an object or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Refresh Interval             | The refresh interval, between 10-300 seconds. The default is 30 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interfaces                   | A comma-separated list of interfaces used for communicating shared licenses to clients. Enter the names of interfaces or interface role objects, or click <b>Select</b> to select interfaces or objects or to create new objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

- [Configuring an ASA Device as a Shared License Server, page 30-65](#)

## Configuring an ASA Device as a Shared License Client

This procedure describes how to configure an ASA device as a shared license client.

### Tip

You must ensure that the SSL VPN Shared License Client activation key is present on the device.

### Step 1

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN Shared License page appears (see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\), page 30-62](#)).

### Step 2

Select **Shared License Client** as the role of the device.

### Step 3

In the Shared Secret field, enter and confirm a case-sensitive string (4-128 characters) used for communicating with the shared license server.

### Step 4

In the License Server field, enter the IP address or the name of a network/host object that identifies the ASA device configured as the license server.

### Step 5

In the License Server Port field, enter the number of the TCP port on which the license server communicates.

### Step 6

Select the role of the client:

- **Client Only**—When selected, the client acts only as the client. In this case, you can specify another device as a backup server.

- **Backup Server**—When selected, the client also acts as the backup server. In this case, you must also specify the interfaces to be used for this purpose.

## Configuring an ASA Device as a Shared License Server

This procedure describes how to configure an ASA device as a shared license server.

### Tip

You must ensure that the SSL VPN Shared License Server activation key is present on the device.

- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.
- The SSL VPN Shared License page appears (see [Configuring SSL VPN Shared Licenses \(ASA 8.2+\)](#), page 30-62).
- Step 2** Select **Shared License Server** as the role of the device.
- Step 3** In the Shared Secret field, enter and confirm a case-sensitive string (4-128 characters) used for communicating with the shared license server.
- Step 4** In the License Server Port field, enter the number of the TCP port on which the license server communicates.
- Step 5** In the Refresh Interval field, enter a value between 10-300 seconds to be used as the refresh interval. Default is 30 seconds.
- Step 6** In the Interfaces field, enter or select the interfaces to be used for communicating with clients.
- Step 7** (Optional.) Select **Configure Backup shared SSL VPN License Server** to configure a backup server for the shared license server, then configure the following:
- **Backup License Server**—The IP address, or network/host object that contains the address, of the server to act as a backup license server if the current one is unavailable.
  - **Backup Server Serial Number**—The serial number of the backup license server.
  - **HA Peer Serial Number**—(Optional) The serial number of the backup server of a failover pair.

## Customizing Clientless SSL VPN Portals

You can customize the web site and its contents that you use for the portal page for a browser-based clientless SSL VPN. ASA devices allow much more customization than IOS devices. You can create several policy objects that define the look of the web pages the user sees when logging into or out of the VPN and the home page for the portal, as well as the bookmarks and smart tunnels available to the user.

This section contains the following topics:

## Configuring ASA Portal Appearance Using SSL VPN Customization Objects

An SSL VPN Customization object describes the appearance of browser-based clientless SSL VPN web pages displayed to users. This includes the Logon page displayed when they connect to the ASA security appliance, the Home page displayed after authentication, and the Logout page displayed when users log out of the SSL VPN service.

You use SSL VPN Customization objects when defining ASA group objects or Remote Access VPN Connection policies for ASA devices. You can create several customization objects and define multiple ASA group or connection profiles so that each user group sees web pages designed specifically for their use. Customization can include localizing the web pages in the languages appropriate for each group. For more information about localization, see [Localizing SSL VPN Web Pages for ASA Devices, page 30-68](#).

Initially, when a user first connects, the default customization object identified in the connection profile determines how the logon screen appears. If the user selects a different group from the connection profile list on the logon page, and that group has its own customization, the screen changes to reflect the customization object for the selected group. After the remote user is authenticated, the screen appearance is determined by the customization object that has been assigned to the group policy.

After you create the SSL VPN customization object as described in this procedure, you can use the object to specify the portal characteristics in these policies:

- On the **SSL VPN > Settings** page in an ASA group policy object (see [ASA Group Policies SSL VPN Settings, page 33-17](#)), which you then select in one of these policies:
  - **Remote Access VPN > Group Policies**
  - **Remote Access VPN > Connection Profiles** on the **General** tab
- In the **Remote Access VPN > Connection Profiles** policy, you can also specify the SSL VPN customization object on the **SSL** tab (see [SSL Tab \(Connection Profiles\), page 30-18](#)).

### Related Topics

- [Localizing SSL VPN Web Pages for ASA Devices, page 30-68](#)
- [Creating Policy Objects, page 6-9](#)
- [Add and Edit SSL VPN Customization Dialog Boxes, page 33-37](#)

---

**Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)).

**Tip** You can also create SSL VPN Customization objects when defining policies or objects that use this object type. For more information, see [Selecting Objects for Policies, page 6-2](#).

---

- Step 2** Select **SSL VPN Customization** from the Object Type selector. The SSL VPN Customization page opens, displaying a list of the existing SSL VPN Customization objects.
- Step 3** Right-click in the work area and select **New Object**.  
The Add SSL VPN Customization dialog box appears (see [Add and Edit SSL VPN Customization Dialog Boxes](#), page 33-37).
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Before you configure settings for the various pages, use the Preview button to view the default settings. Clicking **Preview** opens a browser window to display the current settings for the Logon page, Portal page, or Logout page, whichever one is selected in the table of contents (selecting a page within one of these folders is the same as selecting the parent folder).

---

**Tip** Click **Preview** after making any changes to settings to verify that the changes are what you desire.

---

- Step 6** Configure the settings for the Logon page. This web page is the one users see first when connecting to the SSL VPN portal. It is used for logging into the VPN. Select the following items in the Logon Page folder in the table of contents on the left of the dialog box to view and change the settings:
- **Logon Page**—Specify the title of the web page, which is displayed in the browser’s title bar.
  - **Title Panel**—Determine whether the Logon page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic. For more information about the settings, see [SSL VPN Customization Dialog Box—Title Panel](#), page 33-39.
  - **Language**—If you want to configure translation tables for other languages on the ASA device and use them, you can configure the supported languages and allow users to choose their language. For information about translation tables and localization support, see [Localizing SSL VPN Web Pages for ASA Devices](#), page 30-68. For more information about the settings, see [SSL VPN Customization Dialog Box—Language](#), page 33-40.
  - **Logon Form**—Configure the labels and colors used in the form that accepts user logon information. For more information about the settings, see [SSL VPN Customization Dialog Box—Logon Form](#), page 33-42.
  - **Informational Panel**—If you want to provide extra information to the user, you can enable an informational panel and add text and a logo graphic. For more information about the settings, see [SSL VPN Customization Dialog Box—Informational Panel](#), page 33-43.
  - **Copyright Panel**—If you want to include copyright information on the logon page, you can enable the copyright panel and enter your copyright statement. For more information about the settings, see [SSL VPN Customization Dialog Box—Copyright Panel](#), page 33-44.
  - **Full Customization**—If you do not want to use the security appliance’s built-in logon page, even customized, you can instead enable full customization and supply your own web page. For information on creating the required file, see [Creating Your Own SSL VPN Logon Page for ASA Devices](#), page 30-70. For more information about the settings, see [SSL VPN Customization Dialog Box—Full Customization](#), page 33-45.
- Step 7** Configure the settings for the Portal page. This is the home page for the SSL VPN portal, and is displayed after the users log in. Select the following items in the Portal Page folder in the table of contents on the left of the dialog box to view and change the settings:
- **Portal Page**—Specify the title of the web page, which is displayed in the browser’s title bar.

- **Title Panel**—Determine whether the Portal page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic. For more information about the settings, see [SSL VPN Customization Dialog Box—Title Panel, page 33-39](#).
  - **Toolbar**—Determine whether the Portal page will have a toolbar, which contains a field for entering a URL to browse. For more information about the settings, see [SSL VPN Customization Dialog Box—Toolbar, page 33-45](#).
  - **Applications**—Determine which application buttons will appear on the page. For more information about the settings, see [SSL VPN Customization Dialog Box—Applications, page 33-46](#).
  - **Custom Panes**—Determine how you want to organize the body of the Portal page. The default is a single column with no internal panes. You can create a multiple-column layout, create internal panes that display text or references to URLs, and determine in which column and row to place the panes. For more information about the settings, see [SSL VPN Customization Dialog Box—Custom Panes, page 33-46](#).
  - **Home Page**—Determine how and whether to display URL lists on the home page, and whether to use your own web page for the main body of the Portal page. For more information about the settings, see [SSL VPN Customization Dialog Box—Home Page, page 33-48](#).
- Step 8** Select **Logout Page** to configure the settings of the page displayed when a user logs out of the SSL VPN. You can configure the title, message text, fonts, and colors. For more information about the settings, see [SSL VPN Customization Dialog Box—Logout Page, page 33-49](#).
- Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-12](#).
- Step 10** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).
- Step 11** Click **OK** to save the object.
- 

## Localizing SSL VPN Web Pages for ASA Devices

Localization is the process of providing text in a language that is appropriate for the target users. When you create an SSL VPN Customization object for defining the look of browser-based clientless SSL VPN web pages hosted on an ASA device, you can configure the pages to use the desired language.

To see localized web pages correctly, users must configure their browsers to use UTF-8 encoding (for example, in Internet Explorer, select **View > Encoding > Unicode (UTF-8)**). They also must install the required fonts or language support files for their language using the Regional and Language Options control panel. On the Languages tab, click Details to install the desired languages, and select the appropriate supplemental language settings for East Asian, complex scripting, and right-left languages. On the Advanced tab, select the desired code page conversion tables. If users do not configure the browser correctly, they might see boxes instead of characters.

There are two techniques you can use to localize SSL VPN web pages that are hosted on an ASA device. These techniques are not mutually exclusive; you can use both of them. These are the techniques:

- **Configure the SSL VPN Customization object using the desired language**—When you create the SSL VPN Customization object, you can enter text for labels and messages in non-English, non-ASCII languages in UTF-8 encoding. To enter non-ASCII languages in UTF-8 encoding, you must configure Windows with the correct locale setting and have the required fonts installed. Use the Regional and Language Options control panel to configure your system and install files required

for complex script or East Asian languages. If you want to type in text directly, you also need to install an appropriate keyboard; otherwise, you can use a text editor that supports the language's characters and copy and paste text from a document that contains the text you want to use.

You can also enter non-ASCII languages into SSL VPN Bookmarks objects.

- **Configure translation tables on the ASA device to support the languages you want to make available**—To enable the security appliance to provide language translation for the portal and screens displayed to users, you must define the necessary languages in a translation table and import the table into the security appliance. The software image package for the security appliance includes a translation table template. Every language you list in an SSL VPN Customization object must have a corresponding translation table on the device. Conversely, translation tables for languages that are not listed in the SSL VPN Customization object are ignored.

If you use this technique, you must use the ASA CLI or ASDM to configure and upload the translation tables. You cannot manage the translation tables with Security Manager. However, the SSL VPN Customization object includes settings that allow you to configure automatic browser language selection and to enable users to select their desired language. Thus, if you install translation tables for ten languages, the pages defined in the SSL VPN Customization object will be available to users in all of those languages. For more information on these settings, see [SSL VPN Customization Dialog Box—Language, page 33-40](#).

Although both of the following features require translation tables, they are separate and complementary:

- **Automatic Browser Language Selection**—Automatic browser language selection attempts to select the appropriate language based on the user's browser settings. This technique does not ask for user input. In the SSL VPN Customization object, you create a list of languages that will be used in the negotiation with the browser. During a connection, the security appliance receives a list of languages (and their priorities) from the browser, and looks through your list of languages top to bottom until a match is found. If there is no match, then the language you defined in the list as the default language is used. If you do not specify a default language, English is used.

The languages on the security appliance are labels for the translation tables. The languages must mirror those of the browser, and can consist of groups of up to 8 alphanumeric characters (starting from alpha characters), separated by hyphens. For example, fr-FR-paris-univ8. However, when you add a language to the list in Security Manager, only the first two characters are available.

When looking for a match, the security appliance starts with the longest language name, and if it does not match, it discards the rightmost group of the name. For example, if the preferred language on the browser is fr-FR-paris-univ8, and the security appliance supports fr-FR-paris-univ8, fr-FR-paris, fr-FR, and fr, it matches fr-FR-paris-univ8 and uses the translated strings from that translation table. If fr is the only language on the security appliance, the security appliance considers it a match also, and uses that translation table.

For more information about setting up translation tables, see the user documentation for the ASA device and operating system or the ASDM online help.

- **Language Selector**—By enabling the language selector, you provide the user with the ability to actively select the desired language from a list of languages that you support. This technique does not rely on the browser language settings being configured correctly. The language selector is displayed on the logon page.

## Creating Your Own SSL VPN Logon Page for ASA Devices

You can create your own custom SSL VPN Logon page rather than use the page provided by the security appliance for browser-based clientless SSL VPNs. This is called full customization, and replaces the settings you can configure in the SSL VPN Customization policy object.

To provide your own Logon page, you must create the page, copy it to the Security Manager server, and identify the page on the Full Customization page of the SSL VPN Customization object dialog box. For information on creating SSL VPN Customization objects, see [Configuring ASA Portal Appearance Using SSL VPN Customization Objects, page 30-66](#).

When you enable full customization, all other settings for the Logon page configured in the policy object are ignored. When you deploy your configuration to the ASA device, Security Manager copies your custom page to the device.

The Logon page you create must include all of the HTML code required to present the page correctly, and include special Cisco HTML code that provides the functions for the login form and the Language Selector drop-down list. Keep the following in mind when you create the HTML file:

- The file extension must be **.inc**.
- All images in the custom Logon page must be present on the security appliance. Replace the file path with the keyword **/+CSCOU+/**, which is an internal directory on the ASA device. When you upload an image to the device, it is saved in this directory.
- Use the **cisco\_ShowLoginForm('lform')** Javascript function to add the login form to the page. This form prompts for the username, passwords, and group information. You must include this function somewhere on the page.
- Use the **cisco\_ShowLanguageSelector('selector')** Javascript function to add the Language Selector drop-down list to the page. You do not have to use this function if you are not supporting the use of more than one language.

## Configuring SSL VPN Bookmark Lists for ASA and IOS Devices

When you configure a browser-based clientless SSL VPN, you can define a list of bookmarks, or URLs, to include on the SSL VPN portal page. Use SSL VPN bookmarks policy objects to define bookmark lists.

You can create SSL VPN bookmark objects for SSL VPNs hosted on IOS devices or ASA devices. However, these device types allow different bookmark configurations, the ASA device allowing more configuration options than IOS devices. Besides allowing more configuration options, you can also create bookmarks for ASA devices in non-English, non-ASCII languages. For more information on localizing the bookmarks and portal for ASA devices, see [Localizing SSL VPN Web Pages for ASA Devices, page 30-68](#).

After you create the SSL VPN bookmark object as described in this procedure, you can use the object to specify the bookmark object in the **Portal Web Pages** or **Bookmarks** fields in these policies:

- ASA devices—On the **SSL VPN > Clientless** page in an ASA group policy object (see [ASA Group Policies SSL VPN Clientless Settings, page 33-10](#)), which you then select in one of these policies:
  - **Remote Access VPN > Group Policies**
  - **Remote Access VPN > Connection Profiles** on the **General** tab
- ASA devices—In the **Remote Access VPN > Dynamic Access** policy, you can specify the SSL VPN bookmark object on the **Main > Bookmarks** tab (see [Main Tab, page 31-13](#)).
- IOS devices—On the **Clientless** page in a user group policy object configured for SSL VPN (see [User Group Dialog Box—Clientless Settings, page 33-67](#)), which you then select in the **Remote Access VPN > SSL VPN** policy on the **General** tab.

#### Related Topics

- [Creating Group Policies \(ASA, PIX 7.0+\), page 30-23](#)
- [Configuring Dynamic Access Policies, page 31-2](#)
- [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 30-6](#)
- [Configuring an SSL VPN Policy \(IOS\), page 32-14](#)
- [Creating Policy Objects, page 6-9](#)
- [Policy Object Manager, page 6-4](#)

---

**Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)).

**Tip** You can also create SSL VPN bookmark objects when you define policies or objects that use this object type. For more information, see [Selecting Objects for Policies, page 6-2](#).

---

**Step 2** Select **SSL VPN Bookmarks** from the Object Type selector. The SSL VPN Bookmarks page opens, displaying a list of the existing SSL VPN bookmark objects.

**Step 3** Right-click in the work area, then select **New Object**.

The Add SSL VPN Bookmark dialog box appears (see [Add or Edit Bookmarks Dialog Boxes, page 33-32](#)).

**Step 4** Enter a name for the object and optionally a description of the object.

**Step 5** If you are creating the object for an SSL VPN hosted on an IOS device, you can enter a name for the heading that is displayed above the bookmarks list in the **Bookmarks Heading (IOS)** field.

**Step 6** The Bookmarks table displays any URLs that are defined for the object. To add a bookmark, click the **Add Row** button below the table; to edit an existing bookmark, select it and click the **Edit Row** button.

The Add/Edit SSL VPN Bookmark Entry dialog box opens. For more information about the fields on this dialog box, see [Add and Edit Bookmark Entry Dialog Boxes, page 33-33](#).

- In the **Bookmark Option** field, select whether you are defining a bookmark (**Enter Bookmark**) or adding bookmarks from another SSL VPN bookmark object (**Include Existing Bookmarks**). If you are including an existing object, enter the object's name or click **Select** to select it from a list of existing objects.

- If you are creating the object for use on an IOS device, enter the title of the bookmark, which is displayed to users, and the URL. Be careful to select the correct protocol for the URL. Click **OK** to add the bookmark to the table of bookmarks.
- If you are creating the object for use on an ASA device, you have many more options. Besides the title and the URL, you can define a subtitle and image icon for the bookmark plus other options.

**Tip**

If you choose the protocols RDP, SSH, Telnet, VNC, or ICA, you must configure the plug-in for the protocol in the **Remote Access VPN > SSL VPN > Other Settings** policy (see [Configuring SSL VPN Browser Plug-ins \(ASA\)](#), page 30-50).

You can also configure the bookmark to use the Post method rather than the Get method. If you use Post, you must configure the post parameters by clicking **Add Row** beneath the Post Parameters table. For more information on Post parameters, see these topics:

- [Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks](#), page 30-72
- [Add and Edit Post Parameter Dialog Boxes](#), page 33-36

Click **OK** to add the bookmark to the table of bookmarks.

- Step 7** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects](#), page 6-12.
- Step 8** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden](#), page 6-18.
- Step 9** Click **OK** to save the object.

## Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks

One of the options you have for configuring bookmarks on an SSL VPN hosted on an ASA device is the method used by a URL, either Get or Post. The Get method is the standard method; a user clicks the URL and is taken to the web page. The Post method is useful when processing the data might involve changes to it, for example, storing or updating data, ordering a product, or sending e-mail.

If you choose the Post URL method, you must configure Post parameters for bookmark entries. Because these are often personalized resources that contain the user ID and password or other input parameters, you might need to define clientless SSL VPN macro substitutions.

Clientless SSL VPN macro substitutions let you configure users for access to personalized resources that contain the user ID and password or other input parameters. Examples of such resources include bookmark entries, URL lists, and file shares.

**Note**

For security reasons, password substitutions are disabled for file access URLs (cifs://). Also for security reasons, use caution when introducing password substitutions for web links, especially for non-SSL instances.

You can use the following macro substitutions:

- **Logon Information Substitutions**— The security appliance obtains values for these substitutions from the SSL VPN Logon page. It recognizes these strings in user requests, and replaces them with the value specific to the user before it passes the request on to a remote server.

These are the available macro substitutions:

- CSCO\_WEBVPN\_USERNAME  
The username used to log into the SSL VPN.
- CSCO\_WEBVPN\_PASSWORD  
The password used to log into the SSL VPN.
- CSCO\_WEBVPN\_INTERNAL\_PASSWORD  
The internal resource password entered when logging into the SSL VPN.
- CSCO\_WEBVPN\_CONNECTION\_PROFILE  
The connection profile associated with the user group selected when logging into the SSL VPN.

For example, if a URL list contains the link `http://someserver/homepage/CSCO_WEBVPN_USERNAME.html`, the security appliance translates it to the following unique links:

- For USER1 the link becomes `http://someserver/homepage/USER1.html`
- For USER2 the link is `http://someserver/homepage/USER2.html`

In the following example, `cifs://server/users/CSCO_WEBVPN_USERNAME` lets the security appliance map a file drive to specific users:

- For USER1 the link becomes `cifs://server/users/USER1`
- For USER2 the link is `cifs://server/users/USER2`
- **RADIUS/LDAP Vendor-Specific Attributes (VSAs)**—These substitutions let you set substitutions configured on either a RADIUS or an LDAP server. These are the available macro substitutions:
  - CSCO\_WEBVPN\_MACRO1
  - CSCO\_WEBVPN\_MACRO2

For information on configuring bookmarks, see [Configuring SSL VPN Bookmark Lists for ASA and IOS Devices, page 30-70](#).

## Configuring SSL VPN Smart Tunnels for ASA Devices

A smart tunnel is a connection between an application running on a user's workstation and a private site. The connection uses a clientless (browser-based) SSL VPN session with the security appliance as the pathway and proxy server. Smart tunnels do not require the user to connect the application to the local port, so the application can gain access to the network without giving the user administrative privileges, as is required for full tunnel support. If you do not otherwise configure the network to allow access to an application, you can create a smart tunnel for those applications that you want to support.

You can configure smart tunnel access to an application under the following conditions:

- The application is a Winsock 2, TCP-based application and there is a browser plug-in for the application. Cisco distributes plug-ins for some applications for use in clientless SSL VPN, including SSH (for both SSH and Telnet sessions), RDP, and VNC. You must supply or obtain plug-ins for any other applications. Configure plug-ins in the **Remote Access VPN > SSL VPN > Other Settings** policy on the Plug-Ins tab.
- The user's workstation is a supported platform. See the Cisco ASA 5500 Series Adaptive Security Appliances documentation that corresponds with your ASA version for supported platforms, [http://www.cisco.com/en/US/products/ps6120/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html).

Users of Microsoft Windows Vista who use smart tunnels (or port forwarding) must add the URL of the ASA device to the Trusted Site zone. Configure the Trusted Site zone in Internet Explorer (**Tools > Internet Options, Security** tab).

- The user's browser must be enabled with Java, Microsoft ActiveX, or both.
- If the user's workstation requires a proxy server to reach the security appliance, the URL of the terminating end of the connection must be in the list of URLs excluded from proxy services. In this configuration, smart tunnels support only basic authentication.

**Tip**

A stateful failover does not retain smart tunnel connections. Users must reconnect following a failover.

You configure smart tunnel access for an application by creating an SSL VPN smart tunnel list policy object and including that object in an ASA group policy object. You then assign the ASA group policy object to a device in the **Remote Access VPN > Group Policies** policy.

**Related Topics**

- [Understanding Group Policies \(ASA\), page 30-22](#)
- [Creating Policy Objects, page 6-9](#)
- [Policy Object Manager, page 6-4](#)

**Step 1**

Create an SSL VPN smart tunnel list policy object:

- Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)), and select **SSL VPN Smart Tunnel Lists** from the table of contents.

**Tip**

You can also create SSL VPN smart tunnel list objects when you create or edit the ASA group policy object. For more information, see [Selecting Objects for Policies, page 6-2](#).

- Click the **Add Object** button to open the [Add and Edit Smart Tunnel List Dialog Boxes, page 33-52](#).
- Enter a name for the object, up to 64 characters.
- To the table of applications, add those applications for which you are granting smart tunnel access (click the **Add Row** button to open the [Add and Edit A Smart Tunnel Entry Dialog Boxes, page 33-53](#)). Consider the following:
  - Enter an application name that is easy to understand and include version numbers if you support more than one version. For example, Microsoft Outlook.
  - For the application path, entering only the filename, for example, outlook.exe, is the simplest and most maintainable option. This allows the user to install the application in any folder. Enter the full path if you want to enforce a specific installation structure.
  - Hash values are optional, but you can use them to prevent spoofing. Without hash values, a user can rename an application to a supported filename; the security appliance checks only the filename and path (if specified). However, if you enter hash values, you must maintain them as users apply patches or application upgrades. For specific information on determining hash values, see [Add and Edit A Smart Tunnel Entry Dialog Boxes, page 33-53](#).

Click **OK** to save the entry.

- You can also incorporate other SSL VPN smart list objects into the object. This allows you to create a core set of smart list objects that you can use repeatedly in other objects.

- f. Click **OK** to save the object.

**Step 2** (Optional) Create an SSL VPN smart tunnel auto sign-on list policy object:

- a. Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)), and select **SSL VPN Smart Tunnel Auto Signon Lists** from the table of contents.

**Tip** You can also create SSL VPN smart tunnel auto sign-on list objects when you create or edit the ASA group policy object. For more information, see [Selecting Objects for Policies, page 6-2](#).

- b. Click the **Add Object** button to open the [Add and Edit Smart Tunnel Auto Signon List Dialog Boxes, page 33-55](#).
- c. Enter a name for the object, up to 64 characters.
- d. To the table of smart tunnel auto sign-on entries, add the servers for which to automate the submission of login credentials during smart tunnel setup (click the **Add Row** button to open the [Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes, page 33-56](#)).
- e. You can also incorporate other SSL VPN smart tunnel auto sign-on list objects into the object. This allows you to create a core set of smart tunnel auto sign-on list objects that you can use repeatedly in other objects.
- f. Click **OK** to save the object.

**Step 3** Configure the ASA group policy object to use the SSL VPN smart tunnel list object:

- a. Edit (or create) the ASA group policy object either from the [Policy Object Manager, page 6-4](#) or the **Remote Access VPN > Group Policies** policy. The object must be configured to support SSL VPNs. (You can also edit these objects from the **Remote Access VPN > Connection Profiles** policy from an individual profile.)
- b. Select the **SSL VPN > Clientless** folder from the table of contents to open [ASA Group Policies SSL VPN Clientless Settings, page 33-10](#).
- c. Enter the name of the SSL VPN smart tunnel list object in the **Smart Tunnel** field.
- d. Select **Auto Start Smart Tunnel** to automatically start smart tunnels for the applications when the user connects to the SSL VPN portal.

If you do not select this option, users must start smart tunnel access using the **Application Access > Start Smart Tunnels** button on the clientless SSL VPN portal page.

- e. Enter the name of the SSL VPN smart tunnel auto sign-on list object in the **Smart Tunnel Auto Signon Server List** field.
- f. If the universal naming convention (domain\username) is required for authentication, specify the Windows domain to add it to the username during auto sign-on in the **Domain Name** field. For example, enter CISCO to specify CISCO\qa\_team when authenticating for the username qa\_team. You must also check the Use Domain option when configuring associated entries in the auto sign-on server list.

## Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs

Clientless SSL VPN uses WINS and the Common Internet File System (CIFS) protocol to access or share files, printers, and other machine resources on remote systems. The ASA or IOS device uses a proxy CIFS client to provide this access transparently; users appear to have direct access to the file systems (subject to individual file and user permissions).

When users attempt a file-sharing connection to a Windows computer by using its computer name, the file server they specify corresponds to a specific WINS name that identifies a resource on the network. The security appliance queries WINS or NetBIOS name servers to map WINS names to IP addresses. SSL VPN requires NetBIOS to access or share files on remote systems.

You use WINS server list policy objects to configure the list of WINS servers that are used to resolve these Microsoft file-directory share names. The WINS server list objects define the NetBIOS Name Service (NBNS) server list on the device (using the **nbns-list** and **nbns-server** commands) for Common Internet File System (CIFS) name resolution.

After creating the WINS server list policy object, you can configure it in the following policies and policy objects, and also select the file access services that you want to allow:

- ASA devices—In the **Remote Access VPN > Connection Profiles** policy, specify the WINS server list object on the **SSL** tab (see [SSL Tab \(Connection Profiles\)](#), page 30-18).

Select the file access options on the **SSL VPN > Clientless** page in an ASA group policy object (see [ASA Group Policies SSL VPN Clientless Settings](#), page 33-10), which you then select in one of these policies:

- **Remote Access VPN > Group Policies**
- **Remote Access VPN > Connection Profiles** on the **General** tab

- IOS devices—On the **Clientless** page in a user group policy object configured for SSL VPN (see [User Group Dialog Box—Clientless Settings](#), page 33-67), which you then select in the **Remote Access VPN > SSL VPN** policy on the **General** tab.

- [Creating Policy Objects](#), page 6-9

---

**Step 1** Select **Manage > Policy Objects** to open the [Policy Object Manager](#), page 6-4.

**Tip** You can also create WINS server list objects when defining policies or objects that use this object type. For more information, see [Selecting Objects for Policies](#), page 6-2.

---

**Step 2** Select **WINS Server Lists** from the Object Type selector.

The WINS Server List page opens, displaying the currently defined WINS server list objects.

**Step 3** Right-click in the work area and select **New Object** to open the [Add or Edit WINS Server List Dialog Box](#), page 33-74.

**Step 4** Enter a name for the object and optionally a description of the object.

**Step 5** Click the **Add Row** button below the table, or select a server in the table and click **Edit Row**, to configure the WINS servers defined in the object. Configure these settings:

- **Server**—The IP address of the WINS server. You can select a network/host object or enter the address directly.

- **Set as Master Browser**—Select this option if the server is a master browser, which maintains the list of computers and shared resources.

Other fields are optional; change them if you want non-default values. For more information, see [Add or Edit WINS Server Dialog Box, page 33-74](#).

Click **OK** to save your changes.

- Step 6** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-12](#).
- Step 7** (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See [Allowing a Policy Object to Be Overridden, page 6-18](#).
- Step 8** Click **OK** to save the object.
-

# CHAPTER 31

## Managing Dynamic Access Policies for Remote Access VPNs (ASA 8.0+ Devices)

---

This chapter explains Dynamic Access Policies (DAP) for assigning remote access users to connection profiles (tunnel groups). You can configure these policies for remote access IKEv1 IPsec on ASA 8.0+ devices, IKEv2 IPsec on ASA 8.4(x) devices, and SSL VPNs on ASA 8.0+ (except 8.5) devices.

For information on configuring other remote access policies for ASA and PIX 7.0+ devices, see [Chapter 30, “Managing Remote Access VPNs on ASA and PIX 7.0+ Devices”](#).

This chapter contains the following topics:

- [Understanding Dynamic Access Policies, page 31-1](#)
- [Configuring Dynamic Access Policies, page 31-2](#)
- [Dynamic Access Page \(ASA\), page 31-10](#)

### Understanding Dynamic Access Policies

Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles each user may inhabit within an organization, and logins from remote access sites with different configurations and levels of security. The task of authorizing users is much more complicated in a VPN environment than it is in a network with a static configuration.

Dynamic access policies (DAP) on a security appliance let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. These attributes address issues of multiple group membership and endpoint security. That is, the security appliance grants access to a particular user for a particular session based on the policies you define. It generates a DAP at the time the user connects by selecting and/or aggregating attributes from one or more DAP records. It selects these DAP records based on the endpoint security information of the remote device and the AAA authorization information for the authenticated user. It then applies the DAP record to the user tunnel or session. The DAP system includes the following components that require your attention:

- **DAP Selection Configuration File**—A text file containing criteria that the security appliance uses for selecting and applying DAP records during session establishment. It is stored on the security appliance. You can use Security Manager to modify it and upload it to the security appliance in XML data format. DAP selection configuration files include all of the attributes that you configure. These can include AAA attributes, endpoint attributes, and access policies as configured in network and web-type ACL filter, port forwarding, and URL lists.

- **DfltAccess Policy**—Always the last entry in the DAP summary table, always with a priority of 0. You can configure Access Policy attributes for the default access policy, but it does not contain—and you cannot configure—AAA or endpoint attributes. You cannot delete the DfltAccessPolicy, and it must be the last entry in the summary table.

**Tip**

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

### Integration of Cisco Secure Desktop with DAP

The security appliance integrates the Cisco Secure Desktop (CSD) features into dynamic access policies (DAPs). Depending on the configuration, the security appliance uses one or more endpoint attribute values in combination with optional, AAA attribute values as conditions for assigning a DAP. The Cisco Secure Desktop features supported by the endpoint attributes of DAPs include OS detection, prelogin policies, Basic Host Scan results, and Endpoint Assessment.

As an administrator, you can specify a single attribute or combine attributes that together form the conditions required to assign a DAP to a session. The DAP provides network access at the level that is appropriate for the endpoint AAA attribute value. The security appliance applies a DAP when all of its configured endpoint criteria are satisfied.

## Configuring Dynamic Access Policies

This procedure describes how to create or edit a dynamic access policy.

### Related Topics

- [Understanding Dynamic Access Policies, page 31-1](#)
- [Understanding DAP Attributes, page 31-3](#)
- [Configuring Cisco Secure Desktop Policies on ASA Devices, page 31-8](#)

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- The Dynamic Access page opens. For a description of the elements on this page, see [Dynamic Access Page \(ASA\), page 31-10](#).
- Step 2** Click **Create** or select a policy in the table and click **Edit**.
- The Add/Edit Dynamic Access Policy dialog box opens, with the Main tab open by default. For a description of the elements in this dialog box, see [Table 31-4 on page 31-13](#).
- Step 3** Enter the name of the DAP record (up to 128 characters).

- Step 4** Specify a priority for the DAP record. The security appliance applies access policies in the order you set here, highest number having the highest priority.
- Step 5** Enter a description for the DAP record.
- Step 6** In the **Main** tab, configure the DAP attributes and the type of remote access method supported by the DAP system on your security appliance. For a detailed description of the elements on this tab, see [Table 31-5 on page 31-13](#).
- Click **Create** below the table, or select a DAP entry in the table and click **Edit**. The Add/Edit DAP Entry dialog box opens. For a description of the elements on this dialog box, see [Add/Edit DAP Entry Dialog Box, page 31-19](#).  
For a full description of the procedure to define the DAP attributes, see [Configuring DAP Attributes, page 31-7](#).
  - Select the type of remote access permitted by the DAP system.
  - Select the **Network ACL** tab to select and configure network ACLs to apply to this DAP record.  
This tab is available only if you selected an access method other than Web Portal.
  - Select the **WebType ACL** tab to select and configure Web-type ACLs to apply to this DAP record.  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Functions** tab to configure file server entry and browsing, HTTP proxy, and URL entry for the DAP record.  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Port Forwarding** tab to select and configure port forwarding lists for user sessions.  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **URL List** tab to select and configure URL lists for user sessions.  
This tab is available only if you selected an access method other than AnyConnect Client.
  - Select the **Action** tab to configure the type of remote access permitted.  
This tab is available for all types of access methods.
- Step 7** Select the **Logical Operators** tab to create multiple instances of each type of endpoint attribute. For a description of the elements on this tab, see [Table 31-21 on page 31-37](#).
- Step 8** Select the **Advanced Expressions** tab to set additional attributes for the DAP using free-form LUA. For a description of the elements on this tab, see [Table 31-22 on page 31-39](#).
- Step 9** Click **OK**.
- 

## Understanding DAP Attributes

DAP records include all of the attributes that you configure. These can include AAA attributes, endpoint attributes, and access policies as configured in network and web-type ACL filter, port forwarding and URL lists.

### DAP and AAA Attributes

DAP complements AAA services. It provides a limited set of authorization attributes that can override those AAA provides. The security appliance selects DAP records based on the AAA authorization information for the user and posture assessment information for the session. The security appliance can select multiple DAP records depending on this information, which it then aggregates to create DAP authorization attributes.

You can specify AAA attributes from the Cisco AAA attribute hierarchy, or from the full set of response attributes that the security appliance receives from a RADIUS or LDAP server.

### AAA Attribute Definitions

Table 31-1 on page 31-4 defines the AAA selection attribute names that are available for DAP use. The Attribute Name field shows you how to enter each attribute name in a LUA logical expression, which you might do on the Advanced tab of the Add/Edit Dynamic Access Policy dialog box.

**Table 31-1 AAA Attribute Definitions**

| Attribute Type | Attribute Name        | Source | Value  | Max String Length | Description                 |
|----------------|-----------------------|--------|--------|-------------------|-----------------------------|
| Cisco          | aaa.cisco.memberof    | AAA    | string | 128               | memberof value              |
|                | aaa.cisco.username    | AAA    | string | 64                | username value              |
|                | aaa.cisco.class       | AAA    | string | 64                | class attribute value       |
|                | aaa.cisco.ipaddress   | AAA    | number | –                 | framed-ip address value     |
|                | aaa.cisco.tunnelgroup | AAA    | string | 64                | tunnel-group name           |
| LDAP           | aaa.ldap.<label>      | LDAP   | string | 128               | LDAP attribute value pair   |
| RADIUS         | aaa.radius.<number>   | RADIUS | string | 128               | Radius attribute value pair |

### DAP and Endpoint Security

The security appliance obtains endpoint security attributes by using posture assessment methods that you configure. These include Cisco Secure Desktop and NAC. You can use a match of a prelogin policy, Basic Host Scan entry, Host Scan Extension, or any combination of these and any other policy attributes to assign access rights and restrictions. At minimum, configure DAPs to assign to each prelogin policy and Basic Host Scan entry.

Endpoint Assessment, a Host Scan extension, examines the remote computer for a large collection of antivirus and antispymware applications, associated definitions updates, and firewalls. You can use this feature to combine endpoint criteria to satisfy your requirements before the security appliance assigns a specific DAP to the session.

### DAP and Anti-Virus, Anti-Spyware, and Personal Firewall Programs

The security appliance uses a DAP policy when the user attributes matches the configured AAA and endpoint attributes. The Prelogin Assessment and Host Scan modules of Cisco Secure Desktop return information to the security appliance about the configured endpoint attributes, and the DAP subsystem uses that information to select a DAP record that matches the values of those attributes. Most, but not all, anti-virus, anti-spyware, and personal firewall programs support active scan, which means that the programs are memory-resident, and therefore always running. Host Scan checks to see if an endpoint has a program installed, and if it is memory-resident as follows:

- If the installed program does not support active scan, Host Scan reports the presence of the software. The DAP system selects DAP records that specify the program.

- If the installed program does support active scan, and active scan is enabled for the program, Host Scan reports the presence of the software. Again the security appliance selects DAP records that specify the program.
- If the installed program does support active scan and active scan is disabled for the program, Host Scan ignores the presence of the software. The security appliance does not select DAP records that specify the program. Further, the output of the **debug trace** command, which includes a lot of information about DAP, does not indicate the program presence, even though it is installed.

### Endpoint Attribute Definitions

Table 31-2 on page 31-5 defines the endpoint selection attribute names that are available for DAP use. The Attribute Name field shows you how to enter each attribute name in a LUA logical expression, which you might do on the Advanced tab of the Add/Edit Dynamic Access Policy dialog box. The *label* variable identifies the application, filename, process, or registry entry.

**Table 31-2** Endpoint Attribute Definitions

| Attribute Type                                       | Attribute Name                  | Source      | Value   | Max String Length | Description                                               |
|------------------------------------------------------|---------------------------------|-------------|---------|-------------------|-----------------------------------------------------------|
| Antispyware<br>(Requires<br>Cisco Secure<br>Desktop) | endpoint.as.label.exists        | Host Scan   | true    | –                 | Antispyware program exists                                |
|                                                      | endpoint.as.label.version       |             | string  | 32                | Antispyware description                                   |
|                                                      | endpoint.as.label.description   |             | string  | 128               | class attribute value                                     |
|                                                      | endpoint.as.label.lastupdate    |             | integer | –                 | Seconds since update of antispyware definitions           |
| Antivirus<br>(Requires<br>Cisco Secure<br>Desktop)   | endpoint.av.label.exists        | Host Scan   | true    | –                 | Antivirus program exists                                  |
|                                                      | endpoint.av.label.version       |             | string  | 32                | Antivirus description                                     |
|                                                      | endpoint.av.label.description   |             | string  | 128               | class attribute value                                     |
|                                                      | endpoint.av.label.lastupdate    |             | integer | –                 | Seconds since update of antivirus definitions             |
| Application                                          | endpoint.application.clienttype | Application | string  | –                 | Client type:<br>CLIENTLESS<br>ANYCONNECT<br>IPSEC<br>L2TP |

**Table 31-2 Endpoint Attribute Definitions (Continued)**

|                                             |                                  |                |              |     |                                                                                            |
|---------------------------------------------|----------------------------------|----------------|--------------|-----|--------------------------------------------------------------------------------------------|
| File                                        | endpoint.file.label.exists       | Secure Desktop | true         | –   | The files exists                                                                           |
|                                             | endpoint.file.label.lastmodified |                | integer      | –   | Seconds since file was last modified                                                       |
|                                             | endpoint.file.label.crc.32       |                | integer      | –   | CRC32 hash of the file                                                                     |
| NAC                                         | endpoint.nac.status              | NAC            | string       | -   | User defined status string                                                                 |
| Operating System                            | endpoint.os.version              | Secure Desktop | string       | 32  | Service pack for Windows                                                                   |
|                                             | endpoint.os.servicepack          |                | integer      | –   | Operating system                                                                           |
| Personal firewall (Requires Secure Desktop) | endpoint.fw.label.exists         | Host Scan      | true         | –   | The personal firewall exists                                                               |
|                                             | endpoint.fw.label.version        |                | string       | 32  | Version                                                                                    |
|                                             | endpoint.fw.label.description    |                | string       | 128 | Personal firewall description                                                              |
| Policy                                      | endpoint.policy.location         | Secure Desktop | string       | 64  | Location value from Cisco Secure Desktop                                                   |
| Process                                     | endpoint.process.label.exists    | Secure Desktop | true         | –   | The process exists                                                                         |
|                                             | endpoint.process.label.path      |                | string       | 255 | Full path of the process                                                                   |
| Registry                                    | endpoint.registry.label.type     | Secure Desktop | dword string | –   | dword                                                                                      |
|                                             | endpoint.registry.label.value    |                | string       | 255 | Value of the registry entry                                                                |
| VLAN                                        | endpoint.vlan.type               | CNA            | string       | –   | VLAN type:<br>ACCESS<br>AUTH<br>ERROR<br>GUEST<br>QUARANTINE<br>ERROR<br>STATIC<br>TIMEOUT |

**About Advanced Expressions for AAA or Endpoint Attributes**

In the text box you enter free-form LUA text that represents AAA and/or endpoint selection logical operations. ASDM does not validate text that you enter here; it just copies this text to the DAP policy file, and the security appliance processes it, discarding any expressions it cannot parse.

This option is useful for adding selection criteria other than what is possible in the AAA and endpoint attribute areas above. For example, while you can configure the security appliance to use AAA attributes that satisfy any, all, or none of the specified criteria, endpoint attributes are cumulative, and must all be satisfied. To let the security appliance employ one endpoint attribute or another, you need to create appropriate logical expressions in LUA and enter them here.

### Examples of DAP Logical Expressions

Study these examples for help in creating logical expressions in LUA.

- This AAA LUA expression tests for a match on usernames that begin with "b". It uses the string library and a regular expression:

```
not(string.find(aaa.cisco.username, "^b") == nil)
```

- This endpoint expression tests for a match on CLIENTLESS OR CVC client types:

```
endpoint.application.clienttype=="CLIENTLESS" or endpoint.application.clienttype=="CVC"
```

- This endpoint expression tests for Norton Antivirus versions 10.x but excludes 10.5.x:

```
(endpoint.av.NortonAV.version > "10" and endpoint.av.NortonAV.version < "10.5") or
endpoint.av.NortonAV.version > "10.6"
```

### DAP Connection Sequence

The following sequence outlines a typical remote access connection establishment.

1. A remote client attempts a VPN connection.
2. The security appliance performs posture assessment, using configured NAC and Cisco Secure Desktop Host Scan values.
3. The security appliance authenticates the user via AAA. The AAA server also returns authorization attributes for the user.
4. The security appliance applies AAA authorization attributes to the session, and establishes the VPN tunnel.
5. The security appliance selects DAP records based on the user AAA authorization information and the session posture assessment information.
6. The security appliance aggregates DAP attributes from the selected DAP records, and they become the DAP policy.
7. The security appliance applies the DAP policy to the session.

## Configuring DAP Attributes

The attributes you must define for a DAP policy include specifying the authorization attributes and endpoint attributes. You can also configure network and webtype ACLs, file browsing, file server entry, HTTP proxy, URL entry, port forwarding lists and URL lists.

This procedure describes how to create or edit the AAA and endpoint attributes required for a DAP policy.

- 
- Step 1** Do one of the following:
- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.
- The Dynamic Access page opens. For a description of the elements on this page, see [Dynamic Access Page \(ASA\), page 31-10](#).
- Step 2** Click **Create** on the Dynamic Access policy page, or select the row of a policy in the table on the page, and click **Edit**.
- The Add/Edit Dynamic Access Policy dialog box opens, displaying the Main tab. For a description of the elements on the Main tab, see [Main Tab, page 31-13](#).
- Step 3** Click **Create** below the table, or select a DAP entry in the table and click **Edit**. The Add/Edit DAP Entry dialog box opens. For a description of the elements on this dialog box, see [Add/Edit DAP Entry Dialog Box, page 31-19](#).
- Step 4** Select the attribute type from the Criterion list, then enter the appropriate values. The dialog box values vary based on your selection. Options are:
- AAA Attributes Cisco; see [Table 31-6 on page 31-21](#).
  - AAA Attributes LDAP; see [Table 31-7 on page 31-23](#).
  - AAA Attributes RADIUS; see [Table 31-8 on page 31-23](#).
  - Anti-Spyware; see [Table 31-9 on page 31-24](#).
  - Anti-Virus; see [Table 31-10 on page 31-26](#).
  - AnyConnect Identity; see [Table 31-11 on page 31-27](#).
  - Application; see [Table 31-12 on page 31-28](#).
  - Device; see [Table 31-13 on page 31-29](#).
  - File; see [Table 31-14 on page 31-29](#).
  - NAC; see [Table 31-15 on page 31-31](#).
  - Operating System; see [Table 31-16 on page 31-31](#).
  - Personal Firewall; see [Table 31-17 on page 31-32](#).
  - Policy; see [Table 31-18 on page 31-33](#).
  - Process; see [Table 31-19 on page 31-34](#).
  - Registry; see [Table 31-20 on page 31-35](#).
- Step 5** Click **OK**.
- 

## Configuring Cisco Secure Desktop Policies on ASA Devices

Cisco Secure Desktop (CSD) provides a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system. CSD provides a session-based interface where sensitive data is shared only for the duration of an SSL VPN session.

All session information is encrypted, and all traces of the session data are removed from the remote client when the session is terminated, even if the connection terminates abruptly. This ensures that cookies, browser history, temporary files, and downloaded content do not remain on a system.

When the session closes, CSD overwrites and removes all data using a U.S. Department of Defense (DoD) sanitation algorithm to provide endpoint security protection.

**Note**

A complete explanation of the capabilities and configuration of the Cisco Secure Desktop program is beyond the scope of this document. For information about configuring CSD, and what CSD can do for you, see the materials available online at [http://www.cisco.com/en/US/products/ps6742/tsd\\_products\\_support\\_configure.html](http://www.cisco.com/en/US/products/ps6742/tsd_products_support_configure.html). Select the configuration guide for the CSD version you are configuring.

This procedure describes how to configure the Cisco Secure Desktop feature on an ASA device.

**Before You Begin**

- Make sure a connection profile policy has been configured on the device. See [Configuring Connection Profiles \(ASA, PIX 7.0+\)](#), page 30-6.

**Related Topics**

- [Understanding and Managing SSL VPN Support Files](#), page 29-5

**Step 1**

Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Dynamic Access page opens. For a description of the elements on this page, see [Dynamic Access Page \(ASA\)](#), page 31-10.

**Step 2**

In the Cisco Secure Desktop section, select **Enable CSD** to enable CSD on the ASA device.

**Step 3**

In the **CSD Package** field, specify the name of the File Object that identifies the Cisco Secure Desktop package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see [Add and Edit File Object Dialog Boxes](#), page 33-25.

**Note**

The package version must be compatible with the ASA operating system version. When you create a local policy in Device view, the **Version** field indicates the CSD package version you should select. (The version is included in the package file name. For example, `securedesktop-asa_k9-3.3.0.118.pkg` is CSD version 3.3.0.118.) When you create a shared policy in Policy view, the **Version** field indicates the version of the CSD file you selected. For more information on version compatibility, see [Understanding and Managing SSL VPN Support Files](#), page 29-5.

**Step 4**

(Optional) In the **Hostscan Package** field, specify the name of the File Object that identifies the Host Scan package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see [Add and Edit File Object Dialog Boxes](#), page 33-25.

**Step 5**

Click **Configure** to open the Cisco Secure Desktop Manager (CSDM) Policy Editor that lets you configure CSD on the security appliance. This application is independent of Security Manager; read the CSD documentation cited above for an explanation of how to use the policy editor.

The editor contains these main items (select them in the table of contents):

- **Prelogin Policies**—This is a decision tree. When a user attempts a connection, the user’s system is evaluated against your rules and the first rule that matches is applied. Typically, you create policies for secure locations, home locations, and insecure public locations. You can make your checks based on registry information, the presence of specific files or certificates, the workstation’s operating system, or IP address.

All editing is done through the right-click menu. Right click on boxes or + signs to activate related settings, if any.

For end nodes, you can select these options:

- **Access Denied**—Workstations that match your criteria are prevented from accessing the network.
- **Policy**—You want to define a specific admission policy at this point. After naming the policy, it is added to the table of contents. Select each item in the policy and configure its settings.
- **Subsequence**—You want to perform additional checks. Enter the name of the next decision tree that you want to evaluate for this workstation.
- **Host scan**—You can specify a set of registry entries, file names, and process names, which form a part of the basic host scan. The host scan occurs after the prelogin assessment but before the assignment of a dynamic access policy. Following the basic host scan, the security appliance uses the login credentials, the host scan results, prelogin policy, and other criteria you configure to assign a dynamic access policy. You can also enable:
  - **Endpoint Assessment**—The remote workstation scans for a large collection of antivirus, antispyware, and personal firewall applications, and associated updates.
  - **Advanced Endpoint Assessment**—Includes all of the Endpoint Assessment features, and lets you configure an attempt to update noncompliant workstations to meet the version requirements you specify. You must purchase and install a license for this feature before you can configure it.

## Dynamic Access Page (ASA)

Use the Dynamic Access page to view the dynamic access policies (DAP) defined on the security appliance. From this page, you can create, edit, or delete DAPs.

Use the Cisco Secure Desktop section to enable and download the Cisco Secure Desktop (CSD) software on the selected ASA device. Cisco Secure Desktop provides a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session.

### Note

The CSD client software must be installed and activated on a device in order for an SSL VPN policy to work properly.

### Tip

Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

**Navigation Path**

- (Device View) Select an ASA device; then select **Remote Access VPN > Dynamic Access (ASA)** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hostscan Package | Specify the name of the File Object that identifies the Hostscan package you want to upload to the device.<br><br>Click <b>Select</b> to select an existing File Object or to create a new one. For more information, see <a href="#">Add and Edit File Object Dialog Boxes</a> , page 33-25.                                                                                                                                                                                                                                                                                            |
| Version          | The package version must be compatible with the ASA operating system version. When you create a local policy in Device view, the Version field indicates the CSD package version you should select. (The version is included in the package file name. For example, securedesktop-asa_k9-3.3.0.118.pkg is CSD version 3.3.0.118.) When you create a shared policy in Policy view, the Version field indicates the version of the CSD file you selected. For more information on version compatibility, see <a href="#">Understanding and Managing SSL VPN Support Files</a> , page 29-5. |
| Configure        | Click <b>Configure</b> to open the Cisco Secure Desktop Manager (CSDM) Policy Editor that lets you configure CSD on the security appliance. For a description of the elements in this dialog box, see <a href="#">Cisco Secure Desktop Manager Policy Editor Dialog Box</a> , page 31-40.                                                                                                                                                                                                                                                                                                |

## Add/Edit Dynamic Access Policy Dialog Box

Use the Add/Edit Dynamic Access Policy dialog box to configure the dynamic access policies (DAP) on your security appliance. You can specify a name for the dynamic access policy that you are adding, select the priority, specify attributes in a LUA expression, and set attributes for network and webtype ACL filters, file access, HTTP proxy, URL entry and lists, port forwarding, and clientless SSL VPN access methods.

### Note

For detailed information about dynamic access policy attributes, see [Understanding DAP Attributes](#), page 31-3

These tabs are available in the Add/Edit Dynamic Access Policy dialog box:

- [Main Tab](#), page 31-13
- [Logical Operations Tab](#), page 31-36
- [Advanced Expressions Tab](#), page 31-39

### Navigation Path

Open the [Dynamic Access Page \(ASA\)](#), page 31-10, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit Dynamic Access Policy dialog box is displayed.

| Element                  | Description                                                                                                                                                                                                                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                     | The name of the dynamic access policy record (up to 128 characters).                                                                                                                                                                                                                                             |
| Priority                 | A priority for the dynamic access policy record. The security appliance applies access policies in the order you set here, highest number having the highest priority. In the case of dynamic access policy records with the same priority setting and conflicting ACL rules, the most restrictive rule applies. |
| Description              | Additional information about the dynamic access policy record (up to 1024 characters).                                                                                                                                                                                                                           |
| Main tab                 | Enables you to add a dynamic access policy entry and set attributes for the access policy depending on the type of remote access that you configure.<br><br>For a description of the elements on this tab, see <a href="#">Main Tab, page 31-13</a> .                                                            |
| Logical Operations tab   | Enables you to create multiple instances of each type of endpoint attribute.<br><br>For a description of the elements on this tab, see <a href="#">Logical Operations Tab, page 31-36</a> .                                                                                                                      |
| Advanced Expressions tab | Enables you to configure one or more logical expressions to set AAA or endpoint attributes other than what is possible in the AAA and Endpoint areas.<br><br>For a description of the elements on this tab, see <a href="#">Advanced Expressions Tab, page 31-39</a> .                                           |

**Main Tab**

Use the Main tab of the Add/Edit Dynamic Access Policy dialog box to configure the dynamic access policy attributes and the type of remote access method supported your security appliance. You can set attributes for network and webtype ACL filters, file access, HTTP proxy, URL entry and lists, port forwarding, and clientless SSL VPN access methods.

**Navigation Path**

The Main tab appears when you open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#).

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URL Entry | <p>Using SSL VPN does not ensure that communication with every site is secure. SSL VPN ensures the security of data transmission between the remote user's PC or workstation and the security appliance on the corporate network. If a user then accesses a non-HTTPS web resource (located on the Internet or on the internal network), the communication from the corporate security appliance to the destination web server is not secured.</p> <p>In a clientless VPN connection, the security appliance acts as a proxy between the end user web browser and target web servers. When a user connects to an SSL-enabled web server, the security appliance establishes a secure connection and validates the server SSL certificate. The end user browser never receives the presented certificate, so therefore cannot examine and validate the certificate. The current implementation of SSL VPN does not permit communication with sites that present expired certificates. Neither does the security appliance perform trusted CA certificate validation. Therefore, users cannot analyze the certificate an SSL-enabled web-server presents before communicating with it.</p> <p>Specify how the URL entry setting must be configured on the portal page:</p> <ul style="list-style-type: none"> <li>• <b>Unchanged</b>—Uses values from the group policy that applies to this session.</li> <li>• <b>Enable</b>—Allows a user from entering HTTP/HTTPS URLs on the portal page. If this feature is enabled, users can enter web addresses in the URL entry box, and use clientless SSL VPN to access those websites.</li> <li>• <b>Disable</b>—Disables a user from entering HTTP/HTTPS URLs on the portal page.</li> </ul> <p><b>Note</b> To limit Internet access for users, select <b>Disable</b> for the URL Entry field. This prevents SSL VPN users from surfing the Web during a clientless VPN connection.</p> |

Port Forwarding tab—Lets you select and configure port forwarding lists for user sessions.

**Note** Port Forwarding does not work with some SSL/TLS versions.

**Caution** Make sure Sun Microsystems Java Runtime Environment (JRE) 1.4+ is installed on the remote computers to support port forwarding (application access) and digital certificates.

| User Message | <p>Enter a text message to display on the portal page when this DAP record is selected. Maximum 128 characters. A user message displays as a yellow orb. When a user logs on it blinks three times to attract attention, and then it is still. If several DAP records are selected, and each of them has a user message, all user messages display.</p> <p><b>Note</b> You can include in such messages URLs or other embedded text, which require that you use the correct HTML tags.</p> <p>For example: All contractors please read &lt;a href='http://wwwin.abc.com/procedure.html'&gt;Instructions&lt;/a&gt; for the procedure to upgrade your antivirus software.</p> |

### Add/Edit DAP Entry Dialog Box

Use the Add/Edit DAP Entry dialog box to specify the authorization attributes and endpoint attributes for a dynamic access policy. The security appliance selects the dynamic access policy based on the endpoint security information of the remote device and the AAA authorization information for the authenticated user. It then applies the dynamic access policy to the user tunnel or session.

For detailed information about dynamic access policy attributes, see [Understanding DAP Attributes, page 31-3](#).

The content of the dialog box differs based on the criterion that you select. The criterion is the authorization or endpoint attribute that serves as the selection criterion that the security appliance uses for selecting and applying dynamic access policies during session establishment. You can select from the following criteria:

- AAA Attributes Cisco—Refers to user authorization attributes that are stored in the AAA hierarchical model. See [Add/Edit DAP Entry Dialog Box > AAA Attributes Cisco, page 31-20](#)
- AAA Attributes LDAP—Sets the LDAP client stores all native LDAP response attribute value pairs in a database associated with the AAA session for the user. See [Add/Edit DAP Entry Dialog Box > AAA Attributes LDAP, page 31-22](#).
- AAA Attributes RADIUS—Sets the RADIUS client stores all native RADIUS response attribute value pairs in a database associated with the AAA session for the user. See [Add/Edit DAP Entry Dialog Box > AAA Attributes RADIUS, page 31-23](#).
- Anti-Spyware—Creates an endpoint attribute of type Anti-Spyware. You can use the Host Scan modules of Cisco Secure Desktop to scan for antispyware applications and updates that are running on the remote computer. See [Add/Edit DAP Entry Dialog Box > Anti-Spyware, page 31-24](#).
- Anti-Virus—Creates an endpoint attribute of type Anti-Virus. You can use the Host Scan modules of Cisco Secure Desktop to scan for antivirus applications and updates that are running on the remote computer. See [Add/Edit DAP Entry Dialog Box > Anti-Virus, page 31-25](#).
- AnyConnect Identity—Creates an endpoint attribute of type AnyConnect Identity. See [Add/Edit DAP Entry Dialog Box > AnyConnect Identity, page 31-26](#).
- Application—Indicates the type of remote access connection. See [Add/Edit DAP Entry Dialog Box > Application, page 31-27](#).

- **Device**—Creates an endpoint attribute of type Device. The Device Criterion lets you provide specific device information for use during the associated prelogin policy checking. See [Add/Edit DAP Entry Dialog Box > Device, page 31-28](#).
- **File**—Creates an endpoint attribute of type File. Filename checking to be performed by Basic Host Scan must be explicitly configured using Cisco Secure Desktop Manager. See [Add/Edit DAP Entry Dialog Box > File, page 31-29](#).
- **NAC**—Creates an endpoint attribute of type NAC. NAC protects the enterprise network from intrusion and infection from worms, viruses, and rogue applications by performing endpoint compliancy. We refer to these checks as posture validation. See [Add/Edit DAP Entry Dialog Box > NAC, page 31-30](#).
- **Operating System**—Creates an endpoint attribute of type Operating System. The prelogin assessment module of the CSD can check the remote device for the OS version, IP address, and Microsoft Windows registry keys. See [Add/Edit DAP Entry Dialog Box > Operating System, page 31-31](#).
- **Personal Firewall**—Creates an endpoint attribute of type Personal Firewall. You can use the Host Scan modules of Cisco Secure Desktop to scan for personal firewall applications and updates that are running on the remote computer. For a description of the elements in the dialog box, see [Add/Edit DAP Entry Dialog Box > Personal Firewall, page 31-32](#).
- **Policy**—Creates an endpoint attribute of type Policy. See [Add/Edit DAP Entry Dialog Box > Policy, page 31-33](#).
- **Process**—Process name checking to be performed by Basic Host Scan must be explicitly configured using Cisco Secure Desktop Manager. See [Add/Edit DAP Entry Dialog Box > Process, page 31-34](#).
- **Registry**—Creates an endpoint attribute of type Registry. Registry key scans apply only to computers running Windows Microsoft Windows operating systems. See [Add/Edit DAP Entry Dialog Box > Registry, page 31-35](#).

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed.

**Add/Edit DAP Entry Dialog Box > AAA Attributes Cisco**

To configure AAA attributes as selection criteria for dynamic access policies, in the Add/Edit DAP Entry dialog box, set AAA Attributes Cisco as the selection criterion to be used to select and apply the dynamic access policies during session establishment. You can set these attributes either to match or not match the value you enter. There is no limit for the number of AAA attributes for each dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes Cisco** as the Criterion.

### Add/Edit DAP Entry Dialog Box > AAA Attributes LDAP

The LDAP client stores all native LDAP response attribute value pairs in a database associated with the AAA session for the user. The LDAP client writes the response attributes to the database in the order in which it receives them. It discards all subsequent attributes with that name. This scenario might occur when a user record and a group record are both read from the LDAP server. The user record attributes are read first, and always have priority over group record attributes.

To support Active Directory group membership, the AAA LDAP client provides special handling of the LDAP memberOf response attribute. The AD memberOf attribute specifies the DN string of a group record in AD. The name of the group is the first CN value in the DN string. The LDAP client extracts the group name from the DN string and stores it as the AAA memberOf attribute, and in the response attribute database as the LDAP memberOf attribute. If there are additional memberOf attributes in the LDAP response message, then the group name is extracted from those attributes and is combined with the earlier AAA memberOf attribute to form a comma separated string of group names, also updated in the response attribute database.

#### Note

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

#### Navigation Path

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 31-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes LDAP** as the Criterion.

| Attribute ID | Specify the name of the RADIUS attribute name or number in the dynamic access policy. A maximum of 64 characters is allowed.<br><br>RADIUS attribute names do not contain the cVPN3000 prefix to better reflect support for all three security appliances (VPN 3000, PIX, and the ASA). The appliances enforce the RADIUS attributes based on attribute numeric ID, not attribute name. LDAP attributes are enforced by their name, not by the ID. |
| Value        | Select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the attribute value.                                                                                                                                                                                                                                                                                                                                     |

**Add/Edit DAP Entry Dialog Box > Anti-Spyware**

You can use the Host Scan feature of the Cisco Secure Desktop feature to enable Endpoint Assessment, a scan for antivirus, personal firewall, and antispymware applications and updates that are running on the remote computer. Following the configuration of the prelogin policies and host scan options, you can configure a match of any one or any combination of the Host Scan results to assign a dynamic access policy following the user login.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 31-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Spyware** as the Criterion.

**Add/Edit DAP Entry Dialog Box > Anti-Virus**

You can configure a scan for antivirus applications and updates as a condition for the completion of a Cisco AnyConnect or clientless SSL VPN connection. Following the prelogin assessment, Cisco Secure Desktop loads Endpoint Assessment checks and reports the results back to the security appliance for use in assigning a dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Virus** as the Criterion.

You might want to indicate that an update should occur in less than or greater than the number of days you enter here.                                                                                                                                                                                                                                                                                                                                              |

### Add/Edit DAP Entry Dialog Box > AnyConnect Identity

To configure AnyConnect Identity attributes as selection criteria for dynamic access policies, set AnyConnect Identity as the selection criterion in the Add/Edit DAP Entry dialog box. The ASA generates DAP endpoint attributes based on the AnyConnect Identification attributes received from the AnyConnect mobile client. You are not required to enable Cisco Secure Desktop to configure these specific attributes using Security Manager.

For the purposes of assigning a dynamic access policy, if you configure more than one AnyConnect Identity attribute for a particular DAP entry, the entry will be considered a match if any of the attributes values are true. There is no limit for the number of AnyConnect Identity attributes for each dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AnyConnect Identity** as the Criterion.

**Table 31-11** Add/Edit DAP Entry Dialog Box > AnyConnect Identity

| Element          | Description                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion        | Shows AnyConnect Identity as the selection criterion.                                                                                                                                                                         |
| Client Version   | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the AnyConnect Client version number.                                                                         |
| Platform         | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the appropriate platform from the drop-down list.                                                            |
| Platform Version | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the appropriate version number of the platform.                                                               |
| Device Type      | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the appropriate device type from the drop-down list.                                                         |
| Device Unique ID | Select the check box, select the matching criteria (for example, <i>is</i> ) from the drop-down list, and enter the unique device ID. This ID distinguishes the device allowing you to set policies exclusive to that device. |

**Add/Edit DAP Entry Dialog Box > Application**

Use this dialog box to indicate the type of remote access connection as the endpoint attribute for the dynamic access policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Application** as the Criterion.

**Field Reference****Table 31-12 Add/Edit DAP Entry Dialog Box > Application**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion   | Shows Application as the selection criterion.                                                                                                                                                                                                                                                                                                                                                                              |
| Client Type | Select the check box, then select the matching criteria (for example, <i>is</i> or <i>isn't</i> ) from the drop-down list, and specify the type of remote access connection from the list: AnyConnect, Clientless, Cut-through Proxy, IPsec, or L2TP.<br><br><b>Note</b> If you select AnyConnect as the client type, make sure to enable Cisco Secure Desktop. If it is not enabled, Security Manager generates an error. |

**Add/Edit DAP Entry Dialog Box > Device**

The DAP Device Criterion lets you provide specific device information for use during the associated prelogin policy checking. You can provide one or more of the following attributes for a device—host name, MAC address, port number, Privacy Protection selection—and indicate whether each *is* or *isn't* to be matched.

Note that *isn't* is exclusionary. For example, if you specify the criterion `Host Name isn't zulu_2`, all devices not named `zulu_2` will match.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Choose **Device** as the Criterion.

**Field Reference****Table 31-13 Add/Edit DAP Entry Dialog Box > Device**

| Element            | Description                                                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion          | Shows Device as the selected Criterion.                                                                                                                                                                          |
| Host Name          | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the device host name to be matched.                                                   |
| MAC Address        | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ) from the related drop-down list, and then enter the device's MAC address to be matched.                                               |
| Port Number        | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ), and then enter or Select the device port to be matched.                                                                              |
| Privacy Protection | Select this option, choose a match criterion ( <i>is</i> or <i>isn't</i> ), and then choose the Privacy Protection option defined on the device: <b>none</b> , <b>cache cleaner</b> , or <b>secure desktop</b> . |

**Add/Edit DAP Entry Dialog Box > File**

The file criterion prelogin check lets you specify that a certain file must or must not exist to be eligible for the associated prelogin policy. For example, you might want to use a file prelogin check to ensure a corporate file is present or one or more peer-to-peer file-sharing programs containing malware are not present before assigning a prelogin policy.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **File** as the Criterion.

| Criterion | Shows File as the selection criterion.                                                                                                                                   |
| Type      | Specify whether this endpoint attribute must match or not match the criteria configured for selecting and applying dynamic access policies during session establishment. |

**Table 31-14 Add/Edit DAP Entry Dialog Box > File (Continued)**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Endpoint ID | Select a string that identifies an endpoint for files. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax. |
| Filename    | Specify the filename.                                                                                                                                                                                                                                                                                                                                                                                     |
| Last Update | Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy.<br>Specify the number of days since the last update. You might want to indicate that an update should occur in less than (<) or more than (>) the number of days you enter here.                                                                                                               |
| Checksum    | Available only if you selected the criteria to match the endpoint attribute for the DAP record.<br>Select the check box to specify a checksum to authenticate the file, then enter a checksum in hexadecimal format, beginning with 0x.                                                                                                                                                                   |

**Add/Edit DAP Entry Dialog Box > NAC**

NAC protects the enterprise network from intrusion and infection from worms, viruses, and rogue applications by performing endpoint compliancy and vulnerability checks as a condition for production access to the network. We refer to these checks as *posture validation*. You can configure posture validation to ensure that the anti-virus files, personal firewall rules, or intrusion protection software on a host with an AnyConnect or Clientless SSL VPN session are up-to-date before providing access to vulnerable hosts on the intranet. Posture validation can include the verification that the applications running on the remote hosts are updated with the latest patches. NAC occurs only after user authentication and the setup of the tunnel. NAC is especially useful for protecting the enterprise network from hosts that are not subject to automatic network policy enforcement, such as home PCs. The security appliance uses Extensible Authentication Protocol (EAP) over UDP (EAPoUDP) messaging to validate the posture of remote hosts.

The establishment of a tunnel between the endpoint and the security appliance triggers posture validation. You can configure the security appliance to pass the IP address of the client to an optional audit server if the client does not respond to a posture validation request. The audit server, such as a Trend server, uses the host IP address to challenge the host directly to assess its health. For example, it may challenge the host to determine whether its virus checking software is active and up-to-date. After the audit server completes its interaction with the remote host, it passes a token to the posture validation server, indicating the health of the remote host.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **NAC** as the Criterion.

| Posture Status | Select the matching criteria (for example, <i>is</i> ) from the drop-down list, then enter the posture token string received from ACS. |

**Add/Edit DAP Entry Dialog Box > Operating System**

The prelogin assessment includes a check for the OS attempting to establish a VPN connection. When the user attempts to connect, however, Cisco Secure Desktop checks for the OS, regardless of whether you insert an OS prelogin check.

If the prelogin policy assigned to the connection has Secure Desktop (Secure Session) enabled and if the remote PC is running Microsoft Windows XP or Windows 2000, it installs Secure Session, regardless of whether you insert an OS prelogin check. If the prelogin policy has Secure Desktop enabled and the operating system is Microsoft Windows Vista, Mac OS X 10.4, or Linux, Cache Cleaner runs instead. Therefore, you should make sure the Cache Cleaner settings are appropriate for a prelogin policy on which you have configured Secure Desktop or Cache Cleaner to install. Although Cisco Secure Desktop checks for the OS, you may want to insert an OS prelogin check as a condition for applying a prelogin policy to isolate subsequent checks for each OS.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Operating System** as the Criterion.

|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product ID          | Select a unique identifier for the product that is supported by the selected vendor from the list.                                                                                                                                                             |
| Product Description | Available only if you selected that this endpoint attribute and all its settings must be available on the remote PC.<br>Select the check box, then select the description of the product from the list.                                                        |
| Version             | Available only if you selected that this endpoint attribute and all its settings must be available on the remote PC.<br>Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version. |

**Add/Edit DAP Entry Dialog Box > Policy**

Windows locations let you determine how clients connect to your virtual private network, and protect it accordingly. For example, clients connecting from within a workplace LAN on a 10.x.x.x network behind a NAT device are an unlikely risk for exposing confidential information. For these clients, you might set up a Cisco Secure Desktop Windows Location named Work that is specified by IP addresses on the 10.x.x.x network, and disable both the Cache Cleaner and the Secure Desktop function for this location. Cisco Secure Desktop checks locations in the order listed on the Windows Location Settings window, and grants privileges to client PCs based on the first location definition they match.

**Note**

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

**Navigation Path**

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#) with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Policy** as the Criterion.

|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Shows Policy as the selection criterion.                                                                                                                                                                                                                           |
| Location  | Select the matching criteria (for example, <i>is</i> ) from the drop-down list, and select the Cisco Secure Desktop Microsoft Windows location profile from the list. All the locations configured in the Cisco Secure Desktop Manager are displayed in this list. |

## Add/Edit DAP Entry Dialog Box > Process

You can specify a set of process names, which form a part of Basic Host Scan. The host scan, which includes Basic Host Scan and Endpoint Assessment, or Advanced Endpoint Assessment; occurs after the prelogin assessment but before the assignment of a dynamic access policy. Following the Basic Host Scan, the security appliance uses the login credentials, the host scan results, prelogin policy, and other criteria you configure to assign a DAP.

### Note

Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

### Navigation Path

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 31-12 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Process** as the Criterion.

Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Registry Name | <p>Select the text that describes the registry name from the list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Value         | <p>Select the value, <b>dword</b> or <b>string</b>, from the list, then select the matching criteria (whether it equals or does not equal), and enter a decimal or a string to compare with the dword or string value of the registry key on the remote PC.</p> <p><b>Note</b> “DWORD” refers to the attribute in the Add/Edit Registry Criterion dialog box. “Dword” refers to the attribute as it appears in the registry key. Use the regedit application, accessed on the Windows command line, to view the Dword value of a registry key, or use it to add a Dword value to the registry key to satisfy the requirement you are configuring.</p>                                                                                                                                                                                                                                                                         |
| Ignore Case   | <p>When selected, ignores the case in the registry entry if it includes a string.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Logical Operations Tab

Use the Logical Operations tab of the Add/Edit Dynamic Access Policy dialog box to configure multiple instances of the AAA and each type of endpoint attribute that you defined in the DAP Entry dialog box. On this tab, set each type of endpoint or AAA attribute to require only one instance of a type (Match Any = OR) or to have all instances of a type (Match All = AND).

- If you configure only one instance of an endpoint category, you do not need to set a value.
- For some endpoint attributes, it is not useful to configure multiple instances. For example, no users have more than one running OS.

- You are configuring the Match Any/Match All operation within each endpoint type. The security appliance evaluates each type of endpoint attribute, and then performs a logical AND operation on all of the configured endpoints. That is, each user must satisfy the conditions of ALL of the endpoints you configure, as well as the AAA attributes.

### Navigation Path

Open the [Add/Edit Dynamic Access Policy Dialog Box](#), page 31-12, then click the **Logical Operations** tab.

| Registry | <p>Registry key scans apply only to computers running Windows Microsoft Windows operating systems. Basic Host Scan ignores registry key scans if the computer is running Mac OS or Linux.</p> <p>Select one of the following options if you defined Registry as an endpoint attribute:</p> <ul style="list-style-type: none"> <li>• <b>Match Any</b>—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring.</li> <li>• <b>Match All</b>—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.</li> </ul> |

## Advanced Expressions Tab

Use the Advanced Expressions tab of the Add/Edit Dynamic Access Policy dialog box to set additional attributes for the dynamic access policy. You can configure multiple instances of each type of endpoint attribute. Be aware that this is an advanced feature that requires knowledge of LUA ([www.lua.org](http://www.lua.org)).

### Note

For detailed information about advanced expressions, see [About Advanced Expressions for AAA or Endpoint Attributes](#) and [Examples of DAP Logical Expressions](#).

### Navigation Path

Open the [Add/Edit Dynamic Access Policy Dialog Box, page 31-12](#), then click the **Advanced Expressions** tab.

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Relationship Drop-down List | <p>Specify the relationship between the basic selection rules and the logical expressions you enter on this tab, that is, whether the new attributes add to or substitute for the AAA and endpoint attributes already set. Select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Basic AND Advanced</b>—Creates an AND relationship between the basic and advanced expressions. Both the basic and advanced expressions defined in the dynamic access policy are considered while authenticating users.<br/>By default, this option is selected.</li> <li>• <b>Basic OR Advanced</b>—Creates an OR relationship between the basic and advanced expressions. Users are granted access to a session if either the basic or advanced expressions in the dynamic access policy are matched with the user policy.</li> <li>• <b>Basic Only</b>—Only the basic expressions defined in the DAP entry are used to determine whether the security appliance grants users access to a particular session.</li> <li>• <b>Advanced Only</b>—Only the advanced expressions defined in the DAP entry are used to authorize users for an SSL VPN session.</li> </ul> |
| Advanced Expressions        | <p>Enter one or more logical expressions to set AAA or endpoint attributes other than what is possible in the AAA and Endpoint areas above.</p> <p>Enter free-form LUA text that defines new AAA and/or endpoint selection attributes. Security Manager does not validate text that you enter here; it just copies this text to the dynamic access policy XML file, and the security appliance processes it, discarding any expressions it cannot parse.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Cisco Secure Desktop Manager Policy Editor Dialog Box

Using the Cisco Secure Desktop Manager (CSDM) Policy Editor dialog box, you can configure prelogin policies, specify the checks to be performed between the time the user establishes a connection with the security appliance and the time the user enters the login credentials, and configure host scans. For an explanation of configuring CSD on an ASA device, see [Configuring Cisco Secure Desktop Policies on ASA Devices, page 31-8](#).

### Note

The Cisco Secure Desktop Manager Policy Editor is an independent program. For information about configuring CSD, and what CSD can do for you, see the materials available online at [http://www.cisco.com/en/US/products/ps6742/tsd\\_products\\_support\\_configure.html](http://www.cisco.com/en/US/products/ps6742/tsd_products_support_configure.html). Look specifically for information on configuring prelogin policies and host scan. Select the configuration guide for the CSD version you are configuring.

### Navigation Path

Open the [Dynamic Access Page \(ASA\), page 31-10](#), then click **Configure** from the Cisco Secure Desktop section (you must first specify a CSD package). The CSDM Policy Editor dialog box is displayed.

## CHAPTER 32

# Managing Remote Access VPNs on IOS and PIX 6.3 Devices

---

You can configure and manage remote access IPsec on devices running Cisco IOS Software or PIX 6.3, and SSL VPNs on IOS 12.4(6)T or higher devices (but not on PIX devices). For more information on the specific device models supported, see [Understanding Devices Supported by Each Remote Access VPN Technology](#), page 29-8.

The configuration of these remote access VPNs are the same for these device types. ASA and PIX 7.0+ devices use different configurations for remote access VPNs (as explained in [Chapter 30, “Managing Remote Access VPNs on ASA and PIX 7.0+ Devices”](#)).

The topics in this chapter explain how to configure policies that are specific to IOS and PIX 6.3 devices. Additionally, review the following topics for more information about remote access VPNs:

- [Understanding Remote Access VPNs](#), page 29-1
- [Understanding Devices Supported by Each Remote Access VPN Technology](#), page 29-8
- [Discovering Remote Access VPN Policies](#), page 29-12

- [Configuring an SSL VPN Policy \(IOS\)](#), page 32-14

# Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices

When you configure remote access VPNs on IOS or PIX 6.3 devices, you use the following policies based on the type of VPN you are configuring. Note that you cannot configure SSL VPNs on PIX 6.3 devices.

- **Policies used with both IPsec and SSL remote access VPNs:**
  - **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional; configure it only if you need non-default behavior. For more information, see [Configuring VPN Global Settings, page 25-29](#).
  - **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see [Understanding Public Key Infrastructure Policies, page 25-47](#) and [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52](#).
- **Policies used in remote access IPsec VPNs only:**
  - **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see [Configuring an IKE Proposal, page 25-9](#).
  - **IPsec Proposal (IOS/PIX 6.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\), page 32-3](#).
  - **High Availability**—High Availability (HA) is supported by the creation of an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see [Configuring High Availability in Remote Access VPNs \(IOS\), page 32-11](#).
  - **User Groups (IOS/PIX 6.x)**—A user group policy specifies the attributes that determine user access to and use of the VPN. For more information, see [Configuring User Group Policies, page 32-13](#).
- **Policies used in remote access SSL VPNs only:**
  - **SSL VPN**—The SSL VPN policy table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. For more information, see [Configuring an SSL VPN Policy \(IOS\), page 32-14](#).

# Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices)

This procedure describes how to create or edit an IPsec proposal for your remote access VPN server when the server uses Cisco IOS Software or PIX release 6.3.

An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.

When configuring an IPsec proposal, you must define the external interface through which the remote access clients connect to the server, and the encryption and authentication algorithms that protect the data in the VPN tunnel. You can also select a group authorization (Group Policy Lookup) method that defines the order in which group policies are searched (on the local server or on external AAA servers) and a user authentication (Xauth) method that defines the order in which user accounts are searched.

For more information on IPsec tunnel concepts, see [Understanding IPsec Proposals, page 25-17](#).

When you create or edit an IPsec proposal, you can also configure:

- A VPN Services Module (VPNSM) interface IPsec VPN Shared Port Adapter (VPN SPA) on a Catalyst 6500/7600 device (see [VPNSM/VPN SPA/VSPA Settings Dialog Box, page 32-6](#)).
- A dynamic virtual interface on an IOS router running Cisco IOS Software version 12.4(2)T or later, except 7600 device. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\), page 32-7](#).
- VRF-Aware IPsec on a router or Catalyst 6500/7600 device (see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\), page 32-7](#)).

## Related Topics

- [Understanding VRF-Aware IPsec, page 24-14](#)
- [VPNSM/VPN SPA/VSPA Settings Dialog Box, page 32-6](#)
- [Table Columns and Column Heading Features, page 1-46](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy Type selector. Select an existing policy or create a new one.
- The IPsec Proposal page opens and lists the configured proposals, including the VPN endpoint, IPsec transform set, and whether reverse route injection is configured for the proposal. You can add other columns to the default display to show the AAA, VRF, and dVTI configuration.
- Step 2** Do any of the following:
- To add a new IPsec proposal, click the **Add Row (+)** button and fill in the IPsec Proposal Editor dialog box. For detailed information on the available options, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\), page 32-4](#).
  - To edit an existing proposal, select it and click the **Edit Row (pencil)** button.
  - To delete a proposal, select it and click the **Delete Row (trash can)** button.
-

## IPsec Proposal Editor (IOS, PIX 6.3 Devices)

Use the IPsec Proposal Editor to create or edit an IPsec proposal for an IOS or PIX 6.3 device, including Catalyst 6500/7600, in your remote access VPN. The editor has two tabs—General and Dynamic VTI/VRF Aware IPsec. This topic explains the basic settings on the General tab. For an explanation of Dynamic VTI/VRF Aware IPsec settings, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\)](#), page 32-7.

The elements in this dialog box differ according to the selected device. The table below describes the elements on the General tab in the IPsec Proposal Editor dialog box when a Cisco IOS router, Catalyst 6500/7600, or PIX 6.3 device is selected.

### Note

For a description of the elements in the dialog box when a PIX 7.0+ or ASA device is selected is selected, see [IPsec Proposal Editor \(ASA, PIX 7.0+ Devices\)](#), page 30-33.

### Navigation Path

- (Device view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy selector. Click the Add Row (+) or Edit Row (pencil) buttons.
- (Policy view) Select **Remote Access VPN > IPsec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy Type selector. Select an existing policy or create a new one. Click the Add Row (+) or Edit Row (pencil) buttons.

|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKEv1 Transform Sets                         | <p>The transform sets to be used for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. You can select up to nine transform sets. For more information, see <a href="#">Understanding Transform Sets, page 25-19</a>.</p> <p>If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used.</p> <p>Click <b>Select</b> to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 25-25</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Reverse Route Injection                      | <p>Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. For more information, see <a href="#">Understanding Reverse Route Injection, page 25-20</a>.</p> <p>Select one of the following options to configure RRI on the crypto map:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—Disables the configuration of RRI on the crypto map.</li> <li>• <b>Standard</b>—Creates routes based on the destination information defined in the crypto map access control list (ACL). This is the default option.</li> <li>• <b>Remote Peer</b>—Creates two routes, one for the remote endpoint and one for route recursion to the remote endpoint via the interface to which the crypto map is applied.</li> <li>• <b>Remote Peer IP</b>—Specifies an address as the explicit next hop to the remote VPN device. Enter the IP address or a network/host object that specifies the address, or click <b>Select</b> to select the network/host object from a list or to create a new object.</li> </ul> <p><b>Note</b> If you use network/host objects, you can select the <b>Allow Value Override per Device</b> option in the object to override the IP address, if required, for specific devices that use this object.</p> |
| Group Policy Lookup/AAA Authorization Method | <p>The AAA authorization method list that will be used to define the order in which the group policies are searched. Group policies can be configured on both the local server or on an external AAA server. Remote users are grouped, so that when the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Authentication (Xauth)/AAA Authentication Method | <p>The AAA or Xauth user authentication method that defines the order in which user accounts are searched.</p> <p>Xauth allows all Cisco IOS software AAA authentication methods to perform user authentication in a separate phase after the IKE authentication phase 1 exchange.</p> <p>Click <b>Select</b> to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.</p> |

## VPNSM/VPN SPA/VSPA Settings Dialog Box

### Note

This dialog box is available only if the selected device is a Catalyst 6500/7600.

Use the VPNSM/VPN SPA/VSPA Settings dialog box to specify the settings for configuring a VPN Services Module (VPNSM), a VPN Shared Port Adapter (VPN SPA), or a Cisco VPN Service Port Adapters (VSPAs) on a Catalyst 6500/7600 device.

### Notes

- Before you define the settings, you must import your Catalyst 6500/7600 device to the Security Manager inventory and discover its interfaces. For more information, see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 24-41](#).
- Before you configure VPNSM or VPN SPA with VRF-Aware IPsec on a device, verify that an IPsec proposal with VRF-Aware IPsec and an IPsec proposal without VRF-Aware IPsec were not configured on the device.

### Navigation Path

In the General tab of the IPsec Proposal Editor Dialog Box (for Catalyst 6500/7600 Devices), click **Select** next to the Inside VLAN field. For more information about opening the IPsec Proposal Editor, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\), page 32-4](#).

|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Slot<br>Subslot       | The number designating the slot location of the VPNSM or VPNSPA/VSPA. If you are configuring a VPNSPA/VSPA, the subslot number is also required.<br><br><b>Note</b> If you are configuring a VPNSM, select 0.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| External Port         | The external port or VLAN that connects to the inside VLAN. Enter the name of the VLAN or interface role object, or click <b>Select</b> to select it from a list. You must select an interface or interface role that differs from the one selected for the inside VLAN.<br><br><b>Note</b> If VRF-Aware IPsec is configured on the device, the external port or VLAN must have an IP address. If VRF-Aware IPsec is not configured, the external port or VLAN must not have an IP address.                                                                                                                                       |
| Enable Failover Blade | Whether to configure a failover VPNSM or VPNSPA/VSPA blade for intra-chassis high availability.<br><br><b>Note</b> A VPNSM and VPNSPA/VSPA blade cannot be used on the same device as primary and failover blades.<br><br>Specify the failover blade, as follows: <ul style="list-style-type: none"> <li>• <b>Slot</b>—The slot number that identifies where the VPNSM blade or VPNSPA/VSPA blade is located.</li> <li>• <b>Subslot</b>—If you are configuring a VPNSPA/VSPA, select the number of the subslot on which the failover VPN SPA blade is installed.</li> </ul> <b>Note</b> If you are configuring a VPNSM, select 0. |

## Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices)

### Note

The Dynamic VTI/VRF Aware IPsec tab is available only when the selected device is a Cisco IOS router or Catalyst 6500/7600.

Use the Dynamic VTI/VRF Aware IPsec tab of the IPsec Proposal Editor to configure VRF Aware IPsec settings (on a Cisco IOS router or Catalyst 6500/7600 device), configure a dynamic virtual interface on a Cisco IOS router, or do both, in your remote access VPN.

IOS devices allow dynamic virtual template interfaces (VTIs), which provide highly secure and scalable connectivity for remote-access VPNs, replacing dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels. You can use dynamic VTIs for both the server and remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is duplicated from a virtual template configuration, which includes the IPsec configuration and any features configured on the virtual template interface. Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. They enable dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. Dynamic VTI simplifies VRF-Aware IPsec deployment, as the VRF is configured on the interface.

When this feature is enabled, Security Manager implicitly creates the virtual template interface for the selected device in a remote access VPN. All you must do is provide the IP address on the server that will be used as the virtual template interface, or use an existing loopback interface. The virtual template interface is created on the remote client without an IP address.

### Notes

- You can configure dynamic VTI only on routers running Cisco IOS Release 12.4(2)T and later, except 7600 devices.
- You can configure dynamic VTI with or without VRF-Aware IPsec. For more information about VRF-Aware IPsec, see [Understanding VRF-Aware IPsec, page 24-14](#).
- You can also configure dynamic VTI in a site-to-site Easy VPN topology. For more information, see [Easy VPN with Dynamic Virtual Tunnel Interfaces, page 27-2](#).

### Navigation Path

In the IPsec Proposal Editor Dialog Box (for IOS routers and Catalyst 6500/7600 devices), click the **Dynamic VTI/VRF Aware IPsec** tab. For more information, see [IPsec Proposal Editor \(IOS, PIX 6.3 Devices\), page 32-4](#).

For more information, see <a href="#">VRF-Aware IPsec One-Box Solution, page 24-14</a>.</li> <li>• <b>2-Box (IPsec Aggregator Only)</b>—The PE device does only the MPLS tagging, while the IPsec Aggregator device does the IPsec encryption and decryption from the CEs. For more information, see <a href="#">VRF-Aware IPsec Two-Box Solution, page 24-15</a>.</li> </ul> |
| VRF Name                 | The name of the VRF routing table on the IPsec Aggregator. The VRF name is case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Route Distinguisher      | <p>The unique identifier of the VRF routing table on the IPsec Aggregator. This unique route distinguisher maintains routing separation for each VPN across the MPLS core to the other PE routers. The identifier can be in either of the following formats:</p> <ul style="list-style-type: none"> <li>• <i>IP address:X</i>, where <i>X</i> is in the range of 0-999999999.</li> <li>• <i>N:X</i>, where <i>N</i> is in the range of 0-65535, and <i>X</i> is in the range of 0-999999999.</li> </ul> <p><b>Note</b> You cannot override the RD identifier after deploying the VRF configuration to your device. To modify the RD identifier after deployment, you must manually remove it through the device CLI and then deploy again.</p> |

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Towards Provider Edge | <p>Available only for 2-Box VRF.</p> <p>The VRF forwarding interface on the IPsec Aggregator towards the PE device. Click <b>Select</b> to select the interface or interface role object, or to create a new object that identifies the interface.</p> <p><b>Note</b> If the IPsec Aggregator (hub) is a Catalyst VPN service module, you must specify a VLAN.</p>                                                                                                                                                                             |
| Routing Protocol                | <p>Available only for 2-Box VRF.</p> <p>Select the routing protocol to use between the IPsec Aggregator and the PE. The options are BGP, EIGRP, OSPF, RIPv2, or Static route.</p> <p>If the routing protocol for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, select the routing protocol for redistributing the routing to the secured IGP.</p>                                                                                                                                                 |
| AS Number                       | <p>Available only for 2-Box VRF with BGP or EIGRP routing.</p> <p>The number to use to identify the autonomous system (AS) area between the IPsec Aggregator and the PE. The AS number must be between 1 and 65535.</p> <p>If the routing protocol for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, enter an AS number that identifies the secured IGP into which the routing will be redistributed from the IPsec Aggregator and the PE. This is relevant only if GRE or DMVPN are applied.</p> |
| Process Number                  | <p>Available only for 2-Box VRF with OSPF routing.</p> <p>The routing process ID number to use to configure the routing between the IPsec Aggregator and the PE. The process number must be between 1 and 65535.</p>                                                                                                                                                                                                                                                                                                                           |
| OSPF Area ID                    | <p>Available only for 2-Box VRF with OSPF routing.</p> <p>The ID number of the area in which the packet belongs. You can enter any number from 0 to 4294967295.</p> <p><b>Note</b> All OSPF packets are associated with a single area, so all devices must have the same area ID number.</p>                                                                                                                                                                                                                                                   |
| Redistribute Static Route       | <p>Available only for 2-Box VRF with any routing protocol other than Static route.</p> <p>When selected, enables static routes to be advertised in the routing protocol configured on the IPsec Aggregator towards the PE device.</p> <p><b>Note</b> If this check box is deselected and Enable Reverse Route Injection is enabled (default) for the IPsec proposal, static routes are still advertised in the routing protocol on the IPsec Aggregator.</p>                                                                                   |
| Next Hop IP Address             | <p>Available only for 2-Box VRF with Static routing.</p> <p>The IP address of the provider edge device (or the interface that is connected to the IPsec aggregator).</p>                                                                                                                                                                                                                                                                                                                                                                       |

# Configuring High Availability in Remote Access VPNs (IOS)

Use the High Availability page to configure a High Availability (HA) policy on a Cisco IOS router or Cisco Catalyst switch in a remote access VPN.

In Security Manager, High Availability (HA) is supported by the creation of an HA group made up of two or more devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. By sharing a virtual IP address, the devices in the HA group present the appearance of a single virtual device or default gateway to the remote access users. One device in the HA group is always active and assumes the virtual IP address, while the others are standby devices. The devices in the group watch for hello packets from active and standby devices. If the active device becomes unavailable for any reason, a standby device takes ownership of the virtual IP address and takes over the remote access VPN. This transfer is seamless and transparent to remote access users.

Stateful SwitchOver (SSO) is used to ensure that state information is shared between the HSRP devices in the HA group. If a device fails, the shared state information enables the standby device to maintain IPsec sessions without having to re-establish the tunnel or renegotiate the security associations.

## Tips

- When configuring an HA group, you must provide an inside virtual IP that matches the subnet of one of the interfaces on the device, in addition to a VPN virtual IP that matches the subnet of one of the device's interfaces and is configured with an IPsec proposal. See [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\)](#), page 32-3.
- A remote access VPN server device on which HA is configured cannot be configured as a hub in a site-to-site VPN topology on which HA is configured, using the same outside interface that was used for the remote access VPN server.

---

**Step 1** Do one of the following:

- (Device view) With an IOS device selected, select **Remote Access VPN > IPsec VPN > High Availability** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPsec VPN > High Availability** from the Policy Type selector. Select an existing policy or create a new one.

The High Availability page opens.

**Step 2** Configure the options explained in the following table.

**Table 32-4 High Availability Page, Remote Access VPNs**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inside Virtual IP              | <p>The IP address that is shared by the devices in the HA group and that represents the inside interface of the HA group. The virtual IP address must be on the same subnet as the inside interfaces of the devices in the HA group, but must not be identical to the IP address of any of these interfaces.</p> <p>You must provide an inside virtual IP that matches the subnet of one of the interfaces on the device, in addition to a VPN virtual IP that matches the subnet of one of the device's interfaces and is configured with an IPsec proposal.</p> <p><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.</p> |
| Inside Mask                    | The subnet mask for the inside virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VPN Virtual IP                 | <p>The IP address that is shared by the devices in the HA group and represents the VPN interface of the HA group. This IP address serves as the endpoint of the VPN tunnel.</p> <p><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| VPN Mask                       | The subnet mask for the VPN virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Hello Interval                 | The duration in seconds (within the range of 1-254) between each hello message sent by a device to the other devices in the group to indicate status and priority. The default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hold Time                      | The duration in seconds (within the range of 2-255) that a standby device will wait to receive a hello message from the active device before concluding that the device is down. The default is 15 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Standby Group Number (Inside)  | The standby number of the inside device interface that matches the internal virtual IP subnet for the devices in the HA group. The number must be within the range of 0-255. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Standby Group Number (Outside) | <p>The standby number of the outside device interface that matches the external virtual IP subnet for the devices in the HA group. The number must be within the range of 0-255. The default is 2.</p> <p><b>Note</b> The outside standby group number must be different to the inside standby group number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Failover Server                | The IP address or network/host policy object that identifies the inside interface of the remote peer failover servers. Enter the IP address or network/host object name, or click <b>Select</b> to select an object or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Stateful Failover       | Enables SSO for stateful failover. This option is always selected and you cannot deselect it for remote access VPNs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Configuring User Group Policies

Use the User Groups (IOS/PIX 6.x) policy to specify user groups for your remote access IPsec VPN server. You can configure user groups on a Cisco IOS router, PIX 6.3 Firewall, or Catalyst 6500 /7600 device.

When you configure a remote access VPN server, you must create user groups to which remote clients will belong. A user group policy specifies the attributes that determine user access to and use of the VPN. User groups simplify system management, enabling you to quickly configure VPN access for large numbers of users.

For example, in a typical remote access VPN, you might allow a finance group to access one part of a private network, a customer support group to access another part, and an MIS group to access other parts. In addition, you might allow specific users within MIS to access systems that other MIS users cannot access. User group policies provide the flexibility to do so securely.

Remote clients must have the same group name as the user group configured on the VPN server so that they can connect to the device; otherwise, a connection cannot be established. When a remote client establishes a connection to the VPN server, the group policies for that user group are pushed to all clients belonging to the same user group. You can configure user groups on the local remote access VPN server and external AAA servers.

## Notes

- You can also specify user groups using the Remote Access VPN Configuration Wizard. For more information, see [Using the Remote Access VPN Configuration Wizard, page 29-13](#).
- To specify group policies for an SSL VPN on an IOS device, use the SSL VPN policy as explained in [Configuring an SSL VPN Policy \(IOS\), page 32-14](#).

## Related Topics

- [Understanding Remote Access IPsec VPNs, page 29-2](#)

---

**Step 1** Do one of the following:

- (Device view) With an IOS router, Catalyst 6500/7600, or PIX 6.3 device selected, select **Remote Access VPN > IPsec VPN > User Groups (IOS/PIX 6.x)** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPsec VPN > User Groups (IOS/PIX6.x)** from the Policy Type selector. Select an existing policy or create a new one.

The User Groups page opens.

The page contains two lists: Available User Groups lists all existing User Group policy objects that are configured for remote access IPsec VPNs; Selected User Groups lists all of the User Group policy objects that will be configured on the device.

**Step 2** Ensure that the list of selected user groups contains the desired User Group policy objects:

- To create a new User Group policy object, click the Create (+) button beneath the available user groups list to open the Add User Group dialog box. For instructions on creating the object, see [Add or Edit User Group Dialog Box, page 33-58](#).

After you create the group, it is added to the available list, and you must add it to the selected list if you want to use it.

- To add a User Group to the selected list, select it in the available list and click >>.
- To remove a User Group, select it in the selected list and click <<. If the group is already configured on the device, it will be removed during the next deployment.

- You can edit the properties of a User Group object by selecting it in either list and clicking the **Edit** button.

## Configuring an SSL VPN Policy (IOS)

Use the SSL VPN policy to configure the SSL VPN connection policies for an IOS router. From this page, you can create, edit, or delete SSL VPN policies.

- [Understanding Remote Access SSL VPNs, page 29-2](#)
- [Creating SSL VPNs Using the Remote Access VPN Configuration Wizard \(IOS Devices\), page 29-31](#)
- [Filtering Tables, page 1-45](#)

- Step 1** Do one of the following:
- (Device view) With an IOS device selected, select **Remote Access VPN > SSL VPN** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > SSL VPN > SSL VPN Policy (IOS)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN page appears.

The table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. The status of the context is also shown, either In Service or Out of Service.

- Step 2** Do either of the following:
- To add a context, click the **Add Row** button to open the [SSL VPN Context Editor Dialog Box \(IOS\), page 32-15](#).
  - To edit a context, select it and click the **Edit Row** button.

**Note** To delete a context, select it and click the **Delete Row** button.

- Step 3** Configure at least the following general settings for the policy. For information on other fields, see [General Tab, page 32-16](#).
- **Name, Domain**—For new policies, the name of the context that defines the virtual configuration of the SSL VPN. To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.
  - **Gateway**—The SSL VPN gateway policy object that identifies the gateway device to which users will connect, including interface and port configuration. Click **Select** to select the object from a list or to create a new object.  
When you select the object, the Portal Page URL field shows the URL to which users connect.
  - **Authentication Server Group**—A prioritized list of AAA server group objects that identify the AAA servers to use for authenticating users.

- **User Groups**— The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway.

To add a user group, click **Add Row** to open a list of existing user group policy objects from which you can select the group. If the desired group does not already exist, click the **Create** button below the available groups list and create it. For more information about user group objects, see [Add or Edit User Group Dialog Box](#), page 33-58.

- Step 4** Click the **Portal Page** tab and customize the design of the login page. You can customize the title, the logo graphic, the message that appears above the login prompt, and the background and text colors.

If you want to select a different graphic, you must first copy the graphic onto the Security Manager server. You cannot select it from your workstation's hard drive.

- Step 5** Click the **Secure Desktop** tab to configure Cisco Secure Desktop (CSD) software. CSD policies define entry requirements for client systems and provide a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session.

If you want to use CSD, select **Enable Cisco Secure Desktop** and click **Select** to select a Secure Desktop Configuration policy object, which defines the rules you want to use to control VPN access and host scanning. You can create a new object from the selection list. For information about configuring these objects, see [Creating Cisco Secure Desktop Configuration Objects](#), page 32-18.

**Note** You must install and activate the Secure Desktop Client software on a device for your configuration to work.

- Step 6** Click the **Advanced** tab to configure a maximum number of simultaneous users for the context or if you are using VRF, the name of the VRF instance that is associated with the SSL VPN context.

- Step 7** Click **OK** to save your changes.

## SSL VPN Context Editor Dialog Box (IOS)

Use this dialog box to create or modify a context that defines the virtual configuration of an SSL VPN. For more information, see [Configuring an SSL VPN Policy \(IOS\)](#), page 32-14.

### Navigation Path

Open the SSL VPN (IOS) policy, then click **Add Row (+)**, or select a context in the table and click **Edit Row**. For information on opening the SSL VPN policy, see [Configuring an SSL VPN Policy \(IOS\)](#), page 32-14.

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable SSL VPN              | Whether to activate the SSL VPN connection, putting it “In Service”.                                                                                                                                                                                                                                                                                                                                                                            |
| Name                        | The name of the context that defines the virtual configuration of the SSL VPN.<br><br><b>Note</b> To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.                                                                                                                                                                                                              |
| Gateway                     | The name of the SSL VPN gateway policy object that defines the characteristics of the gateway to which users connect when entering the VPN. A gateway object provides the interface and port configuration for an SSL VPN connection.<br><br>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                            |
| Domain                      | The domain or virtual hostname of the SSL VPN connection.                                                                                                                                                                                                                                                                                                                                                                                       |
| Portal Page URL             | The URL for the SSL VPN, which is filled in when you select a gateway object. Users connect to this URL to enter the VPN.                                                                                                                                                                                                                                                                                                                       |
| Authentication Server Group | The authentication server groups. The list is in prioritized order. Authentication is attempted using the first group and proceeds through the list until the user is successfully authenticated or denied. Use the LOCAL group if the users are defined on the gateway itself.<br><br>Enter the names of the AAA server groups; separate multiple entries with commas. You can click <b>Select</b> to select the groups or to create new ones. |
| Authentication Domain       | A list or method for SSL VPN remote user authentication. If you do not specify a list or method, the gateway uses global AAA parameters for remote-user authentication.                                                                                                                                                                                                                                                                         |
| Accounting Server Group     | The accounting server group. Enter the name of the AAA server group policy object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                   |

**Table 32-6** *SSL VPN Context Editor General Tab (IOS) (Continued)*

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Groups | <p>The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client, CIFS file access, and thin client is enabled for the group.</p> <ul style="list-style-type: none"> <li>To add a user group, click <b>Add Row</b> to open a list of existing user group policy objects from which you can select the group. If the desired group does not already exist, click the <b>Create</b> button below the available groups list and create it. For more information about user group objects, see <a href="#">Add or Edit User Group Dialog Box, page 33-58</a>.</li> <li>To edit a user group, select it and click the <b>Edit Row</b> button.</li> <li>To delete a user group, select it and click the <b>Delete Row</b> button. This deletes the group only from the policy, it does not delete the user group policy object.</li> </ul> |

## Creating Cisco Secure Desktop Configuration Objects

Cisco Secure Desktop (CSD) Configuration objects define the settings you want to use if you enable Secure Desktop in an SSL VPN policy for an IOS device (see [Configuring an SSL VPN Policy \(IOS\), page 32-14](#)). For ASA devices, the feature is set up as part of the Dynamic Access Policy (see [Understanding Dynamic Access Policies, page 31-1](#) and [Configuring Cisco Secure Desktop Policies on ASA Devices, page 31-8](#)).

Cisco Secure Desktop (CSD) provides a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system. CSD provides a session-based interface where sensitive data is shared only for the duration of an SSL VPN session. All session information is encrypted, and all traces of the session data are removed from the remote client when the session is terminated, even if the connection terminates abruptly.

### About Windows Locations

Windows locations let you determine how clients connect to your virtual private network, and protect it accordingly. For example, clients connecting from within a workplace LAN on a 10.x.x.x network behind a NAT device are an unlikely risk for exposing confidential information. For these clients, you might set up a CSD Windows Location named Work that is specified by IP addresses on the 10.x.x.x network, and disable both the Cache Cleaner and the Secure Desktop function for this location.

In contrast, users' home PCs might be considered more at risk to viruses due to their mixed use. For these clients, you might set up a location named Home that is specified by a corporate-supplied certificate that employees install on their home PCs. This location would require the presence of antivirus software and specific, supported operating systems to grant full access to the network.

Alternatively, for untrusted locations such as Internet cafes, you might set up a location named "Insecure" that has no matching criteria (thus making it the default for clients that do not match other locations). This location would require full Secure Desktop functions, and include a short timeout period to prevent access by unauthorized users. If you create a location and do not specify criteria, make sure it is the last entry in the Locations list.

- Setting Up CSD for Microsoft Windows Clients, [http://www.cisco.com/en/US/docs/security/csd/csd311/csd\\_for\\_vpn3k\\_cat6k/configuration/guide/CSDwin.html](http://www.cisco.com/en/US/docs/security/csd/csd311/csd_for_vpn3k_cat6k/configuration/guide/CSDwin.html)
- [Creating Policy Objects, page 6-9](#)

- 
- Step 1** Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)).
- Step 2** Select **Cisco Secure Desktop Configuration** from the Object Type selector.
- Step 3** Right-click in the work area and select **New Object** to open the [Add or Edit Secure Desktop Configuration Dialog Box, page 33-23](#).
- Step 4** Enter a name for the object and optionally a description of the object.
- Step 5** Select **Windows Location Settings** to create locations (such as Work, Home, or Insecure), and define the location-based settings (also called adaptive policies) for CSD.
- a. For each location you want to configure, enter its name in the **Location to Add** field and click **Add** to move it to the Locations field. You can reorder the locations using the Move Up and Move Down buttons. When users connect, these locations are evaluated in order and the first one that matches is used to define the policies for the user.  
  
When you add a location, a folder for the location is added to the table of contents. The folder and its subfolders define the policies for the location.
  - b. If you want all the open browser windows to close after the Secure Desktop installation, make sure to select the corresponding check box.
  - c. Select the required check boxes to configure a VPN Feature policy that enables web browsing, file access, port forwarding, and full tunneling, if installation or location matching fails.
- Step 6** Select the folders and subfolders for the Windows locations you added and configure their settings. For detailed information about these settings, see *Setting Up CSD for Microsoft Windows Clients* at [http://www.cisco.com/en/US/docs/security/csd/csd311/csd\\_for\\_vpn3k\\_cat6k/configuration/guide/CSDwin.html](http://www.cisco.com/en/US/docs/security/csd/csd311/csd_for_vpn3k_cat6k/configuration/guide/CSDwin.html).
- Step 7** Select **Windows CE** to configure a VPN feature policy to enable or restrict web browsing and remote server file access for remote clients running Microsoft Windows CE.
- Step 8** Select **Mac and Linux Cache Cleaner** to configure the Cache Cleaner and a VPN Feature Policy for these clients, such as enabling or restricting web browsing, remote server file access, and port forwarding.
- Step 9** (Optional) Under Category, select a category to help you identify this object in the Objects table. See [Using Category Objects, page 6-12](#).
- Step 10** Click **OK** to save the object.
-

## Configuring Policy Objects for Remote Access VPNs

---

There are several policy objects that you use primarily or exclusively with remote access VPNs. Some of these objects, the ASA Group Policies and User Group objects, are also used with Easy VPN site-to-site topologies. This reference explains the configuration of these policy objects.

This chapter contains the following topics:

- [ASA Group Policies Dialog Box, page 33-1](#)
- [Add or Edit Secure Desktop Configuration Dialog Box, page 33-23](#)
- [Add and Edit File Object Dialog Boxes, page 33-25](#)
- [Add or Edit Port Forwarding List Dialog Boxes, page 33-28](#)
- [Add or Edit Single Sign On Server Dialog Boxes, page 33-30](#)
- [Add or Edit Bookmarks Dialog Boxes, page 33-32](#)
- [Add and Edit SSL VPN Customization Dialog Boxes, page 33-37](#)
- [Add or Edit SSL VPN Gateway Dialog Box, page 33-50](#)
- [Add and Edit Smart Tunnel List Dialog Boxes, page 33-52](#)
- [Add and Edit Smart Tunnel Auto Signon List Dialog Boxes, page 33-55](#)
- [Add or Edit User Group Dialog Box, page 33-58](#)
- [Add or Edit WINS Server List Dialog Box, page 33-74](#)

### ASA Group Policies Dialog Box

Use the Add or Edit ASA Group Policies dialog box to create, copy, and edit an ASA user group policies object.

ASA group policies are configured on ASA security appliances in Easy VPN topologies, remote access IPSec VPNs, and remote access SSL VPNs. When you configure an Easy VPN or remote access VPN, you must create group policies to which remote clients will belong. A group policy is a set of user-oriented attribute/value pairs for VPN connections that are stored either internally (locally) on the device or externally on a AAA server. The tunnel group uses a group policy that sets terms for user connections after the tunnel is established. Group policies let you apply whole sets of attributes to a user or a group of users rather than having to specify each attribute individually for each user.

**Note**

You must select the technology for which you are creating the object. Depending on the selected technology, the appropriate settings are available for configuration. If you select the IKEv1 or IKEv2 options, the IKE Proposal and IPsec Proposal policies must also be configured to support the selected IKE version.

**Navigation Path**

Select **ASA Group Policies** in the [Policy Object Manager, page 6-4](#). Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Tip**

You can also create objects while configuring policies that use this type of object, including Connection Profile policies for remote access and Easy VPN, or the Group Policies policy for remote access VPNs.

**Field Reference**

**Table 33-1 Add or Edit ASA Group Policies Dialog Box, including Technology Settings**

| Element     | Description                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> . |
| Description | An optional description of the object.                                                                                                                                 |

**Settings Pane**

The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right.

You must first configure technology settings, then you can select items from the table of contents on the left and configure the options you require. Your selections on the Technology page control which options are available on these pages and in the table of contents.

The top folders in the table of contents represent the VPN technologies or other settings that you can configure, and are explained next.

**Table 33-1 Add or Edit ASA Group Policies Dialog Box, including Technology Settings**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technology settings | <p>These settings control what you can define in the group policy:</p> <ul style="list-style-type: none"> <li>• <b>Group Policy Type</b>—Whether you are storing the group policy on the ASA device itself (<b>Internal</b>) or on a AAA server (<b>External</b>). You cannot change this option when editing an object.<br/><br/>If you select <b>External</b>, the only attributes you can configure are the name of the AAA server group object that identifies the AAA server and its password.</li> <li>• <b>Technology</b>—The types of VPN for which this object defines group policies. Select all that apply: <ul style="list-style-type: none"> <li>– Easy VPN/IPSec IKEv1—For Easy VPN topologies or remote access IPsec VPNs that allow IKEv1 negotiations.</li> <li>– Easy VPN/IPSec IKEv2—For remote access IPsec VPNs that allow IKEv2 negotiations. IKEv2 is not supported in Easy VPN topologies.</li> <li>– SSL Clientless—For remote access SSL VPNs of all types, not just clientless.</li> </ul> </li> <li>• <b>External Server Group</b>—If you are storing the group policy attributes on an external AAA server, specify the AAA server group that will be used for authentication. Click <b>Select</b> to select the object from a list or to create a new object.<br/><br/>After you select an external server group, the <b>Password</b> and <b>Confirm</b> fields become active. Enter the alphanumeric password to use for authenticating with the server in both fields. The password can be a maximum of 128 characters; spaces are not allowed.</li> </ul> |
| DNS/WINS            | <p>The DNS and WINS servers and the domain name that should be pushed to clients associated with the group. See <a href="#">ASA Group Policies DNS/WINS Settings, page 33-20</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Split Tunneling     | <p>Settings to allow a remote client to conditionally direct encrypted packets through a secure tunnel to the central site and simultaneously allow clear text tunnels to the Internet through a network interface. See <a href="#">ASA Group Policies Split Tunneling Settings, page 33-21</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Easy VPN/IPSec VPN  | <p>Settings for Easy VPN and remote access IPsec VPNs:</p> <ul style="list-style-type: none"> <li>• <b>Client Configuration</b>—The Cisco client parameters for the group. ## ASA Group Policies Client Configuration Settings

Use the Client Configuration settings page to configure the Cisco client parameters for the ASA group policy for Easy VPN or remote access VPN.

### Navigation Path

Select **Easy VPN/IPSec VPN > Client Configuration** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

### Field Reference

**Table 33-2 ASA Group Policies Client Configuration Settings**

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Store Password on Client System   | Whether to allow users to store a password on their local systems. Enable this feature only if you are certain that the local systems will be in secure sites.                                                                                                                                                                                                                                                                                                                                                                    |
| Enable IPsec over UDP<br>UDP Port | Whether to allow a Cisco VPN client or hardware client to connect using UDP to a security appliance that is running NAT.<br><br>If you select this option, specify the UDP port number within the range of 4001-49151. In IPsec negotiations, the security appliance listens on the configured port and forwards UDP traffic for that port even if other filter rules drop UDP traffic.<br><br><b>Note</b> The Cisco VPN client must also be configured to use IPsec over UDP, which is configured by default on certain devices. |

**Table 33-2** ASA Group Policies Client Configuration Settings (Continued)

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPsec Backup Servers Servers List | <p>Specify the backup server configuration:</p> <ul style="list-style-type: none"> <li>• <b>Keep Client Configuration</b>—The security appliance sends no backup server information to the client. The client uses its own backup server list, if configured. This is the default.</li> <li>• <b>Clear Client Configuration</b>—The client uses no backup servers. The security appliance pushes a null server list.</li> <li>• <b>Use Specified Backup Servers</b>—Use the backup servers you specify in the servers list. Enter the IP addresses of the servers, or the name of a network/host object. Click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> <p>You can configure backup servers either on the client or on the primary security appliance. If you configure backup servers on the security appliance, it pushes the backup server policy to the clients in the group, replacing the backup server list on the client if one is configured.</p> |

## ASA Group Policies Client Firewall Attributes

Use the Client Firewall Attributes settings to configure the firewall settings for VPN clients for the ASA group policy for Easy VPN or remote access IPsec VPN. Only VPN clients running Microsoft Windows can use these firewall settings.

### Navigation Path

Select **Easy VPN/IPsec VPN > Client Firewall Attributes** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

## Field Reference

Table 33-3 ASA Group Policies Client Firewall Attributes

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall Mode | <p>The firewall requirements for client systems for the group:</p> <ul style="list-style-type: none"> <li>• <b>No Firewall</b>—Do not use a firewall. You cannot configure any other options on the page.</li> <li>• <b>Firewall Required</b>—All users in this group must use the designated firewall. The security appliance drops any session that attempts to connect without the designated firewall installed and running. In this case, the security appliance notifies the VPN client that its firewall configuration does not match.</li> </ul> <p><b>Note</b> Make sure the group does not include any clients other than Windows VPN Clients. Any other clients in the group (including VPN 3002 Hardware Clients) are unable to connect if you require a client firewall.</p> <ul style="list-style-type: none"> <li>• <b>Firewall Optional</b>—Users can use a firewall but it is not required. This option allows all users in the group to connect. Those who have a firewall can use it; users that connect without a firewall receive a warning message. This setting is useful if you are creating a group in which some users have firewalls and others do not. For example, you might have clients with systems that do not run Microsoft windows, or your clients have not all had the opportunity to install firewall software.</li> </ul> |
| Firewall Type | <p>The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco, Network ICE, Sygate, and Zone Labs.</p> <ul style="list-style-type: none"> <li>• If you select Custom Firewall, you must fill in the fields in the Custom Firewall group. You also need to configure the policy source; select options only if they are supported by the vendor.</li> <li>• Some firewall types require you to specify the source of the policy implemented by the firewall.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Policy Source | <p>Some types of firewall allow you to configure where the client firewall should obtain its policies:</p> <ul style="list-style-type: none"> <li>• <b>Get Policy From Remote Firewall</b>—The policy is configured in the client firewall application. This is how most client firewalls work.</li> <li>• <b>Use Specified Policy</b>—The policy you specify should be pushed to the client firewall application, which should use your policy.</li> </ul> <p>You must enter the name of an extended access control list policy object, or click <b>Select</b> to select one from a list or to create a new one, in both in the <b>Inbound Traffic Policy</b> and <b>Outbound Traffic Policy</b> fields.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 33-3** ASA Group Policies Client Firewall Attributes (Continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom Firewall | <p>The attributes that define the required or optional firewall if you select custom firewall as the firewall type:</p> <ul style="list-style-type: none"> <li>• Vendor ID—The number that identifies the vendor of the custom firewall. Values are 1-255.</li> <li>• Product ID—The number that identifies the product or model of the custom firewall. Values are 1-32 or 255. Multiple ranges are allowed, for example, 4-12, 24-32. Use 255 for all supported products.</li> <li>• Description—An optional description of the custom firewall, for example, the name of the vendor and product.</li> </ul> |

## ASA Group Policies Hardware Client Attributes

Use the Hardware Client Attributes settings to configure the VPN 3002 Hardware Client settings for the ASA group policy in an Easy VPN or remote access IPSec VPN.

### Navigation Path

Select **Easy VPN/IPSec VPN > Hardware Client Attributes** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

### Field Reference

**Table 33-4** ASA Group Policies Hardware Client Attributes

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Require Interactive Client Authentication | <p>Whether to enable secure unit authentication, which provides additional security by requiring VPN hardware clients to authenticate with a username and password each time that the client initiates a tunnel. The hardware client does not have a saved username and password.</p> <p><b>Note</b> Secure unit authentication requires that you have an authentication server group configured for the tunnel group the hardware clients use. If you require secure unit authentication on the primary security appliance, be sure to configure it on any backup servers as well.</p> |
| Require Individual User Authentication    | <p>Whether to require that individual users behind a hardware client authenticate to gain access to the network across the tunnel. Individual users authenticate according to the order of authentication servers that you configure.</p> <p>If you do not select this option, the security appliance allows inheritance of a value for user authentication from another group policy.</p>                                                                                                                                                                                              |
| Enable Cisco IP Phone Bypass              | <p>Whether to allow IP phones behind hardware clients to connect without undergoing a user authentication processes. Secure unit authentication remains in effect for other users.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 33-4 ASA Group Policies Hardware Client Attributes (Continued)

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable LEAP Bypass           | <p>Whether to enable Lightweight Extensible Authentication Protocol (LEAP) packets from wireless devices behind a VPN hardware client to travel across a VPN tunnel prior to user authentication. This action lets workstations using Cisco wireless access point devices establish LEAP authentication and then authenticate again per user authentication.</p> <p><b>Note</b> LEAP is an 802.1X wireless authentication method that implements mutual authentication between a wireless client on one side of a connection and a RADIUS server on the other side. The credentials used for authentication, including a password, are always encrypted before they are transmitted over the wireless medium.</p> |
| Allow Network Extension Mode | <p>Whether to enable network extension mode for hardware clients.</p> <p>Network extension mode lets hardware clients present a single, routable network to the remote private network over the VPN tunnel. IPsec encapsulates all traffic from the private network behind the hardware client to networks behind the security appliance. PAT does not apply. Devices behind the security appliance have direct access to devices on the private network behind the hardware client over the tunnel, and only over the tunnel, and vice versa. The hardware client must initiate the tunnel, but after the tunnel is up, either side can initiate data exchange.</p>                                              |
| Idle Timeout Mode            | <p>How to handle periods of inactivity from individual clients:</p> <ul style="list-style-type: none"> <li>Specified Timeout—If there is no communication activity by a user behind a hardware client for the number of minutes you specify, the security appliance terminates the client's access. Values are 1-35791394 minutes.</li> <li>Unlimited Timeout—User sessions are not terminated due to inactivity.</li> </ul>                                                                                                                                                                                                                                                                                      |

## ASA Group Policies IPsec Settings

Use the IPsec settings to specify tunneling protocols, filters, connection settings, and servers for the ASA group policy for Easy VPN or remote access IPsec VPN. This creates security associations that govern authentication, encryption, encapsulation, and key management.

### Navigation Path

Select **Easy VPN/IPsec VPN > IPsec** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

## Field Reference

Table 33-5 ASA Group Policies IPsec Settings

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Re-Authentication on IKE Re-Key | Whether the security appliance should prompt the user to enter a username and password during initial Phase 1 IKE negotiation and also prompt for user authentication whenever an IKE rekey occurs, providing additional security. Reauthentication fails if no user is at the other end of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable IPsec Compression               | <p>Whether to enable data compression, which speeds up transmission rates for remote dial-in users connecting with modems.</p> <p> <b>Caution</b> Data compression increases the memory requirement and CPU usage for each user session and consequently decreases the overall throughput of the security appliance. For this reason, it is recommended that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users and enable compression only for them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Perfect Forward Secrecy (PFS)   | Whether to enable the use of Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. In IPsec negotiations, PFS ensures that each new cryptographic key is unrelated to any previous key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Tunnel Group Lock                      | <p>Tunnel group lock restricts users by checking if the group configured in the VPN client is the same as the tunnel group to which the user is assigned. If it is not, the security appliance prevents the user from connecting.</p> <p>If you do not specify a tunnel name, the security appliance authenticates users without regard to the assigned group. Group locking is disabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Client Access Rules table              | <p>The access rules for clients. These rules control which types of clients are denied access, if any. You can have up to 25 rules, and combined they are limited to 255 characters.</p> <p><b>Tip</b> If you define any rule, an implicit deny all rule is added. Thus, if a client matches no permit rule, the client is denied access. If you create rules, ensure that you have permit rules for all allowed clients. You can use * as a wildcard to match partial strings.</p> <p>The rule with the lowest integer has the highest priority. Therefore, the rule with the lowest integer that matches a client type or version is the rule that applies. If a lower priority rule contradicts, the security appliance ignores it.</p> <ul style="list-style-type: none"> <li>To add a rule, click the <b>Add Row</b> button to open the <a href="#">Add or Edit Client Access Rules Dialog Box</a>, page 33-10.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete</b> button.</li> </ul> |

## Add or Edit Client Access Rules Dialog Box

Use the Client Access Rules dialog box to create or edit the priority, action, VPN client type and VPN client version for a client access rule.

### Navigation Path

From [ASA Group Policies IPsec Settings, page 33-8](#), click the **Add Row** button beneath the Client Access Rules table, or select a rule and click the **Edit Row** button.

### Field Reference

**Table 33-6 Add or Edit Client Access Rules Dialog Box**

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority                              | <p>The relative priority of the rule.</p> <p>The rule with the lowest integer has the highest priority. Therefore, the rule with the lowest integer that matches a client type or version is the rule that applies. If a lower priority rule contradicts, the security appliance ignores it. Values are 1-65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Action                                | Whether this rule permits or denies traffic access to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VPN Client Type<br>VPN Client Version | <p>The type or version of VPN client to which this rule applies. Spaces are allowed.</p> <p>You can use * as a wildcard to match zero or more characters. You can use n/a for clients that do not send their type or version. The strings you enter in these fields must match the strings displayed using the <b>show vpn-sessiondb remote</b> command on the ASA device.</p> <p>Following are some examples, where priority, permit/deny, type, and version are shown in order:</p> <ul style="list-style-type: none"> <li><b>3 Deny * version 3.*</b> is a priority 3 rule that denies all client types with software version 3.x.</li> <li><b>5 Permit VPN3002 *</b> is a priority 5 rule that allows VPN3002 clients of all software versions.</li> <li><b>255 Permit * *</b> is a priority 255 rule that allows all types and versions of clients. This is useful if you are only trying to deny specific types of clients without wanting to create permit rules for all the other types.</li> </ul> |

## ASA Group Policies SSL VPN Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in a remote access SSL VPN for the ASA group policy object.

When a user connects to the SSL VPN in clientless mode, the user logs into the SSL VPN portal page. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers, depending on how you configure the portal.

**Navigation Path**

Select **SSL VPN > Clientless** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

**Field Reference****Table 33-7 ASA Group Policies SSL VPN Clientless Settings**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Portal Page Websites          | The name of the SSL VPN bookmarks policy object that includes the website URLs to display on the portal page. These websites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                            |
| Allow Users to Enter Websites | Whether to allow the remote user to enter website URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable File Server Browsing   | Whether to allow the remote user to browse for file shares on the CIFS file servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable File Server Entry      | Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Hidden Shares          | Whether to make hidden CIFS shares visible, and thus accessible, to users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HTTP Proxy                    | The type of access you want to allow to the external HTTP proxy server to which the security appliance forwards HTTP connections. You can enable access, disable access, or select Auto Start, which starts the proxy automatically upon user login.                                                                                                                                                                                                                                                                                                                                                 |
| Filter ACL                    | The name of the web type access control list policy object to use to restrict user access to the SSL VPN. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                    |
| Enable ActiveX Relay          | Whether to enable ActiveX relay, which allows users to start ActiveX programs from the portal page. This allows users to start Microsoft Office applications from the web browser and upload and download Office documents.                                                                                                                                                                                                                                                                                                                                                                          |
| UNIX Authentication Group ID  | The UNIX authentication group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| UNIX Authentication User ID   | The UNIX authentication user ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Smart Tunnel                  | The name of the smart tunnel list policy object assigned to this group. Click <b>Select</b> to select it from a list or to create a new object.<br><br>A smart tunnel is a connection between a Winsock 2, TCP-based application and a private site. The connection uses a clientless (browser-based) SSL VPN session with the security appliance as the pathway, and the security appliance as a proxy server. Thus, smart tunnels do not require users to have administrator privileges. For more information, see <a href="#">Configuring SSL VPN Smart Tunnels for ASA Devices, page 30-73</a> . |

**Table 33-7 ASA Group Policies SSL VPN Clientless Settings (Continued)**

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Start Smart Tunnel              | Whether to start smart tunnel access automatically upon user login. If you do not select this option, the user must start the tunnel manually through the Application Access tools on the portal page.<br><br>Auto sign-on supports only applications that use HTTP and HTTPS using the Microsoft WININET library on a Microsoft Windows operating system. For example, Microsoft Internet Explorer uses the WININET dynamic linked library to communicate with web servers. |
| Smart Tunnel Auto Signon Server List | The name of the smart tunnel auto sign-on list policy object assigned to this group. Click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                 |
| Domain Name (Optional)               | The Windows domain to add to the username during auto sign-on, if the universal naming convention (domain\username) is required for authentication. For example, enter CISCO to specify CISCO\qa_team when authenticating for the username qa_team. You must also check the Use Domain option when configuring associated entries in the auto sign-on server list.                                                                                                           |
| Port Forwarding List                 | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                      |
| Auto Start Port Forwarding           | Whether to start port forwarding automatically upon user login.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Port Forwarding Applet Name          | The application name or short description to display on the Port Forwarding Java applet screen on the portal, up to 64 characters. This is the name of the applet users will download to act as a TCP proxy on the client machine for the services configured on the SSL VPN gateway.                                                                                                                                                                                        |
| VDI Servers List table               | The Citrix XenApp or XenDesktop servers that comprise the Virtual Desktop Infrastructure. <ul style="list-style-type: none"> <li>To add a VDI server, click the <b>Add Row</b> button to open the <a href="#">Add or Edit VDI Server Dialog Box</a>, page 33-12.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete</b> button.</li> </ul>                                                |

## Add or Edit VDI Server Dialog Box

Use the VDI Server dialog box to create or edit a Citrix XenApp or XenDesktop Server entry.

In a Virtual Desktop Infrastructure (VDI) model, administrators publish enterprise applications or desktops pre-loaded with enterprise applications, and end users remotely access these applications. These virtualized resources appear just as any other resources, such as email, so that users do not need to go through a Citrix Access Gateway to access them. Users log onto the ASA using Citrix Receiver mobile client, and the ASA connects to a pre-defined Citrix XenApp or XenDesktop Server. The administrator must configure the Citrix server's address and logon credentials under Group Policy so that when users connect to their Citrix Virtualized resource, they enter the ASA's SSL VPN IP address and credentials instead of pointing to the Citrix Server's address and credentials. When the ASA has verified the credentials, the receiver client starts to retrieve entitled applications through the ASA.

## Supported Mobile Devices

- iPad—Citrix Receiver version 4.x or later
- iPhone/iTouch—Citrix Receiver version 4.x or later
- Android 2.x/3.x/4.0/4.1 phone—Citrix Receiver version 2.x or later
- Android 4.0 phone—Citrix Receiver version 2.x or later

## Navigation Path

From [ASA Group Policies SSL VPN Clientless Settings, page 33-10](#), click the **Add Row** button beneath the VDI Servers List table, or select a rule and click the **Edit Row** button.

## Field Reference

**Table 33-8 Add or Edit VDI Server Dialog Box**

| Element                | Description                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------|
| Hostname/IP Address    | Address of the XenApp or XenDesktop server. This value can be a clientless macro.                         |
| Port Number (Optional) | Port number for connecting to the Citrix server. This value can be a clientless macro.                    |
| Domain                 | Domain for logging into the virtualization infrastructure server. This value can be a clientless macro.   |
| Secure HTTP            | Check the checkbox if you want the server to connect using SSL.                                           |
| Username               | Username for logging into the virtualization infrastructure server. This value can be a clientless macro. |
| Password               | Password for logging into the virtualization infrastructure server. This value can be a clientless macro. |

## ASA Group Policies SSL VPN Full Client Settings

Use the Full Client settings to configure the full client mode of access to the corporate network in a remote access SSL VPN for the ASA group policy object.

Full client mode enables access to the corporate network completely over an SSL VPN tunnel. In full client access mode, the tunnel connection is determined by the group policy configuration. The full client software, SSL VPN Client (SVC) or AnyConnect, is downloaded to the remote client, so that a tunnel connection is established when the remote user logs in to the SSL VPN gateway.

### Tip

To enable full client access, you must configure the **Remote Access VPN > SSL VPN > Other Settings** policy on the device to identify AnyConnect image packages to install on the device. The images must be on the device so that users can download them. For more information, see [Understanding SSL VPN AnyConnect Client Settings, page 30-52](#) and [Add and Edit File Object Dialog Boxes, page 33-25](#).

## Navigation Path

Select **SSL VPN > Full Client** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

## Field Reference

Table 33-9 ASA Group Policies SSL VPN Full Client Settings

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Full Client                        | Whether to enable full client mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Mode                                      | <p>The mode in which to operate the SSL VPN:</p> <ul style="list-style-type: none"> <li>• <b>Use Other Access Modes if AnyConnect Client Download Fails</b>—If the full client fails to download to the remote user, allow the user to make clientless or thin client access to the VPN.</li> <li>• <b>Full Client Only</b>—Prohibit clientless or thin client access. The user must have the full client installed and functional to connect to the VPN.</li> </ul>                                                                                                                                                                                                                                   |
| Keep AnyConnect Client on Client System   | Whether to leave the AnyConnect client installed on the client system after the client disconnects. If you do not leave the client installed, it must be download each time the user connects to the gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable Keepalive Messages                 | <p>Whether to exchange keepalive messages between peers to demonstrate that they are available to send and receive data in the tunnel. Keepalive messages transmit at set intervals, and any disruption in that interval results in the creation of a new tunnel using a backup device.</p> <p>If you select this option, enter the time interval (in seconds) that the remote client waits between sending IKE keepalive packets in the <b>Interval</b> field.</p>                                                                                                                                                                                                                                    |
| SSL Compression                           | <p>Whether to enable data compression, and if so, the method of data compression to use: None, Deflate, or LZS. Data compression speeds up transmission rates for remote dial-in users connecting with modems.</p> <p> <b>Caution</b> Data compression increases the memory requirement and CPU usage for each user session and consequently decreases the overall throughput of the security appliance. For this reason, it is recommended that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users and enable compression only for them.</p> |
| Client Dead Peer Detection Timeout (sec)  | <p>The time interval, in seconds, that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the remote user.</p> <p>DPD is used to send keepalive messages between peer devices only when no incoming traffic is received and outbound traffic needs to be sent.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| Gateway Dead Peer Detection Timeout (sec) | The time interval, in seconds, that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 33-9 ASA Group Policies SSL VPN Full Client Settings (Continued)**

| <b>Element</b>                                       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Renegotiation Method                             | <p>The method by which the tunnel key is refreshed for the remote user group client:</p> <ul style="list-style-type: none"> <li>• <b>Disabled</b>—Disables the tunnel key refresh.</li> <li>• <b>Use Existing Tunnel</b>—Renegotiates the SSL tunnel connection.</li> <li>• <b>Create New Tunnel</b>—Initiates a new tunnel connection.</li> </ul> <p>Enter the time interval (in minutes) between the tunnel refresh cycles in the <b>Interval</b> field.</p> |
| Enable Datagram Transport Layer Security             | <p>Whether to enable Datagram Transport Layer Security (DTLS) connections for the group.</p> <p>Enabling DTLS allows the AnyConnect client establishing an SSL VPN connection to use two simultaneous tunnels, an SSL tunnel and a DTLS tunnel. Using DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.</p>                          |
| Enable Datagram Transport Layer Security Compression | <p>Whether to compress Datagram Transport Layer Security (DTLS) connections for the group.</p>                                                                                                                                                                                                                                                                                                                                                                 |

Table 33-9 ASA Group Policies SSL VPN Full Client Settings (Continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| AnyConnect Module       | <p>The modules that the AnyConnect client needs to enable optional features. Click <b>Select</b> to select the applicable modules from the Add AnyConnect Module dialog box.</p> <ul style="list-style-type: none"> <li>• <b>AnyConnect DART</b>—Select this module to enable the AnyConnect Diagnostics and Reporting Tool (DART), which bundles specified log files and diagnostic information that can be used for analyzing and debugging the client connection.</li> <li>• <b>AnyConnect Network Access Manager</b>—Select this module to enable the Network Access Manager, which enforces administratively defined end user and authentication policies and makes the pre-configured network profiles available to end users.</li> <li>• <b>AnyConnect SBL</b>—Select this module to enable Start Before Logon (SBL), which forces the user to connect to the enterprise infrastructure over a VPN connection before logging on to Windows by starting AnyConnect before the Windows login dialog box appears. After authenticating to the ASA, the Windows login dialog appears, and the user logs in as usual. SBL is only available for Windows and lets you control the use of login scripts, password caching, mapping network drives to local drives, and more.</li> <li>• <b>AnyConnect Web Security Module</b>—Select this module to enable the AnyConnect Web Security module, which is an endpoint component that routes HTTP traffic to a ScanSafe scanning proxy where the ScanSafe web scanning service evaluates it.</li> <li>• <b>AnyConnect Telemetry Module</b>—Select this module to enable the AnyConnect telemetry module for AnyConnect Secure Mobility Client, which sends information about the origin of malicious content to the web filtering infrastructure of the Cisco IronPort Web Security Appliance (WSA). The web filtering infrastructure uses this data to strengthen its web security scanning algorithms, improve the accuracy of the URL categories and web reputation database, and ultimately provide better URL filtering rules.</li> <li>• <b>AnyConnect Posture Module</b>—Select this module to enable the AnyConnect Posture Module, which provides the AnyConnect Secure Mobility Client the ability to identify the operating system, antivirus, antispymware, and firewall software installed on the host. The Host Scan application, which is among the components delivered by the posture module, is the application that gathers this information.</li> </ul> <p><b>Note</b> If other options are listed, see the release notes for the Cisco AnyConnect VPN Client for an explanation of the feature.</p> |
| AnyConnect MTU          | The maximum transmission unit (MTU) size for SSL VPN connections established by the Cisco AnyConnect VPN Client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| AnyConnect Profile Name | The name of the AnyConnect profile to use for the group. You must configure this name and relate it to a profile in the <b>Remote Access VPN &gt; SSL VPN &gt; Other Settings</b> policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 33-9 ASA Group Policies SSL VPN Full Client Settings (Continued)**

| Prompt User to Choose Client<br>Time User Has to Choose<br>Default Location | <p>Whether to ask the user to download the client. Enter the number of seconds the user has to make a selection in the <b>Time User Has to Choose</b> field. The default is 120 seconds.</p> <p>If you do not select this option, the user is immediately taken to the default location. The user is also taken to the default location after the time to choose expires.</p> <ul style="list-style-type: none"> <li>• <b>Web Portal</b>—The portal page is loaded in the web browser.</li> <li>• <b>AnyConnect Client</b>—The AnyConnect client is downloaded.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| AnyConnect Firewall-Client Public ACL                                       | The name of the extended access control list policy object to use to restrict user access to the SSL VPN. Public rules are applied to all interfaces on the client. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| AnyConnect Firewall-Client Private ACL                                      | The name of the extended access control list policy object to use to restrict user access to the SSL VPN. Private rules are applied to the Virtual Adapter. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AnyConnect Custom Attributes table                                          | <p>The AnyConnect Custom Attribute table lists the custom attributes that are assigned to this group policy. AnyConnect custom attributes that are defined on the AnyConnect Custom Attribute tab of the SSL VPN Other Settings page are listed here (see <a href="#">Configuring AnyConnect Custom Attributes (ASA), page 30-59</a>). You can add or remove the custom attributes for a group policy, and configure values for each attribute.</p> <ul style="list-style-type: none"> <li>• To add a custom attribute, click the <b>Add Row</b> button beneath the table and fill in the Add AnyConnect Custom Attribute dialog box.</li> <li>• To edit a custom attribute, select it, click the <b>Edit Row</b> button, and make your changes in the Edit AnyConnect Custom Attribute dialog box.</li> <li>• To delete a custom attribute, select it and click the <b>Delete Row</b> button. You are asked to confirm the deletion.</li> </ul> |

## ASA Group Policies SSL VPN Settings

Use the SSL VPN Settings to configure attributes that are required for clientless and port forwarding (thin client) access modes to work, including auto signon rules for user access to servers. Auto Signon configures the security appliance to automatically pass SSL VPN user login credentials (username and password) on to internal servers. You can configure multiple auto signon rules.

### Navigation Path

Select **SSL VPN > Settings** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

## Field Reference

Table 33-10 ASA Group Policies SSL VPN Settings

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Home Page                                 | The URL of the SSL VPN home page. The page is displayed when users log into the VPN. If you do not enter a URL, no home page is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Authentication Failure Message            | The message to deliver to a remote user who successfully logs into the VPN but has no VPN privileges, and so can do nothing. The default message is:<br><br>“Login was successful, but because certain criteria have not been met or due to some specific group policy, you do not have permission to use any of the VPN features. Contact your IT administrator for more information.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Minimum Keepalive Object Size (kilobytes) | The minimum size (in kilobytes) of an IKE keepalive packet that can be stored in the cache on the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Single Sign On Server                     | The name of the single sign on (SSO) server policy object that identifies the server to use for this group, if any. An SSO server allows users to enter their username and password once and be able to access other server in the network without logging into each of them. If configure an SSO server, also configure the auto signon rules table.<br><br>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Add or Edit Single Sign On Server Dialog Boxes, page 33-30</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable HTTP Compression                   | Whether to allow an HTTP compressed object to be cached on the security appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Auto Signon Rules table                   | If you configure a single sign on server, the auto signon rules table contains the rules that determine which internal servers are provided the user’s credentials. Thus, you can provide single sign on for some servers in your network but not others.<br><br>Each rule is an allow rule, and indicates the IP address, subnet, or Universal Resource Identifier (URI) that identifies the server, and the type of authentication that will be sent to the server when the user tries to access it (either basic HTML, NTLM, FTP, or all of these). The rules are processed in order, top to bottom, and the first match is applied. Therefore, be sure to order the rules correctly using the up and down arrow buttons.<br><br>If the user accesses a server that is not identified in one of these rules, the user must log into the server to gain access. <ul style="list-style-type: none"> <li>To add a rule, click the <b>Add Row</b> button to open the <a href="#">Add or Edit Auto Signon Rules Dialog Box, page 33-19</a>.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete Row</b> button.</li> </ul> |

**Table 33-10 ASA Group Policies SSL VPN Settings (Continued)**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Portal Page Customization | <p>The name of the SSL VPN customization policy object that defines the appearance of the portal web page. The portal page allows the remote user access to all the resources available on the SSL VPN network. If you do not specify an object, the default page appearance is used.</p> <p>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Configuring ASA Portal Appearance Using SSL VPN Customization Objects</a>, page 30-66.</p>                                                                                                                                                                                                                             |
| User Storage Location     | <p>The location where personalized user information is stored between clientless SSL VPN sessions. If you do not specify a location, information is not stored between sessions. Stored information is encrypted.</p> <p>Enter a file system designation in the following format:</p> <p><b>protocol://username:password@host:port/path</b></p> <p>Where <b>protocol</b> is the protocol of the server, <b>username</b> and <b>password</b> are a valid user account on the server, and <b>host</b> is the name of the server. Also indicate the <b>port</b> number (if you do not use the default for the protocol) and directory <b>path</b> of the location on the server to use. For example:</p> <p><b>cifs://newuser:12345678@anyfiler02a/new_share</b></p> |
| Storage Key Confirm       | The storage key used to protect data stored between sessions. Spaces are not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Post Max Size             | The maximum size allowed for a posted object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent posting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Upload Max Size           | The maximum size allowed for an uploaded object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent uploading.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Download Max Size         | The maximum size allowed for a downloaded object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent downloads.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Add or Edit Auto Signon Rules Dialog Box

Use the Add or Edit Auto Signon Rules dialog box to configure the Auto Signon rules that the security appliance uses to pass SSL VPN user login credentials on to an internal server.

### Navigation Path

Open the [ASA Group Policies SSL VPN Settings](#), page 33-17, then click **Create**, or select an item in the table and click **Edit**.

**Field Reference****Table 33-11 Add or Edit Auto Signon Rules Dialog Box**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow IP            | <p>Select this option to configure an IP address or subnet for the rule. Any server within this subnet is supplied the specified login credentials.</p> <ul style="list-style-type: none"> <li>To enter the IP address of a single server, enter the full IP address and use 255.255.255.255 as the subnet mask.</li> <li>To specify a subnet, enter the network address and subnet mask, for example, IP address 10.100.10.0 mask 255.255.255.0.</li> </ul> <p>If you want the appliance to send credentials to any internal server the user tries to access, create rules for all of your internal networks. You might be able to do this with a single rule.</p> |
| Allow URI           | <p>Select this option to configure a Universal Resource Identifier (URI) for the rule. This identifies the internal server based on URI rather than IP address. For example, <b>https://*.example.com/*</b> creates a rule for all web pages on any server in the example.com domain. Use the asterisk as a wildcard to apply to zero or more characters.</p>                                                                                                                                                                                                                                                                                                       |
| Authentication Type | <p>The type of credentials that the security appliance will pass on to the servers covered by this rule: Basic HTML, NTLM (NT LAN Manager) authentication, FTP, or all of these methods.</p> <p>The default option is <b>All</b>. Use the default unless you want to limit logins to a certain type.</p>                                                                                                                                                                                                                                                                                                                                                            |

## ASA Group Policies DNS/WINS Settings

Use the DNS/WINS settings to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the ASA group policy. These settings apply to Easy VPN and remote access IPsec and SSL VPN configurations.

**Navigation Path**

Select **DNS/WINS** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

**Field Reference****Table 33-12 ASA Group Policies DNS/WINS Settings**

| Element              | Description                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary DNS Server   | The IP address of the primary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.   |
| Secondary DNS Server | The IP address of the secondary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. |
| Primary WINS Server  | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |

**Table 33-12 ASA Group Policies DNS/WINS Settings (Continued)**

| Element               | Description                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Secondary WINS Server | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. |
| DHCP Network Scope    | The scope of the DHCP network for the group. Enter the IP network address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.     |
| Default Domain        | The default domain name for the group. The default, blank, is none.                                                                                                                                   |

## ASA Group Policies Split Tunneling Settings

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet. These settings apply to Easy VPN and remote access IPsec and SSL VPN configurations.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

### Tip

For optimum security, we recommend that you not enable split tunneling.

### Navigation Path

Select **Split Tunneling** from the table of contents in the [ASA Group Policies Dialog Box, page 33-1](#).

### Field Reference

**Table 33-13 ASA Group Policies Split Tunneling Settings**

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Names                               | A list of domain names to be resolved through the split tunnel. All other names are resolved using the public DNS server. If you do not enter a list, the list is inherited from the default group policy.<br><br>Separate multiple entries with spaces or commas. The entire string can be a maximum of 255 characters.                                                                                                                            |
| Send all DNS traffic through the tunnel | Whether the AnyConnect client should resolve all DNS addresses through the VPN tunnel (SSL or IPsec/IKEv2). If DNS resolution through the tunnel fails, the address remains unresolved and the AnyConnect client does not try to resolve the address through public DNS servers.<br><br>If you do not select this option, the client sends DNS queries over the tunnel according to the split tunnel policy specified by the Tunnel Option setting. |

**Table 33-13** ASA Group Policies Split Tunneling Settings (Continued)

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Option | <p>The policy you want to enable for split tunneling:</p> <ul style="list-style-type: none"> <li>Disabled—(Default) No traffic goes in the clear or to any other destination than the security appliance. Remote users reach networks through the corporate network and do not have access to local networks.</li> <li>Tunnel Specified Traffic—Tunnel all traffic from or to the networks permitted in the network ACL. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider.</li> <li>Exclude Specified Traffic—Traffic goes in the clear from and to the networks permitted in the network ACL. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel. This option applies only to the Cisco VPN Client.</li> </ul> |
| Networks      | <p>The name of a standard access control list policy object that identifies the networks that require traffic to travel across the tunnel and those that do not require tunneling. How permit and deny are interpreted depends on your selection for <b>Tunnel Option</b>.</p> <p>Enter the name of the object, or click <b>Select</b> to select it from a list or to create a new object. If you do not specify an ACL, the network list is inherited from the default group policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                            |

## ASA Group Policies Connection Settings

Use the Connection Settings to configure the connection characteristics for the ASA group policy, including access control and session timeouts. These settings are used for Easy VPN and remote access IPsec or SSL VPN sessions.

### Navigation Path

Select **Connection Settings** from the table of contents in the [ASA Group Policies Dialog Box](#), page 33-1.

### Field Reference

**Table 33-14** ASA Group Policies Connection Settings

| Element     | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter ACL  | <p>The name of the extended access control list (ACL) policy object to use for filtering traffic on the VPN connection. The ACL determines which traffic is permitted or denied. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.</p> <p>This ACL does not apply to clientless SSL VPN connections.</p> |
| Banner Text | <p>The banner, or welcome text, to display on remote clients when they connect to the VPN. You can enter up to 500 characters.</p>                                                                                                                                                                                                                             |

**Table 33-14 ASA Group Policies Connection Settings (Continued)**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address Pools           | Specifies the name of one or more IPv4 address pools to use for this group policy. Enter the names of the IPv4 address pool objects separated by a comma or click <b>Select</b> to select the objects from a list or to create a new objects.                                                                                                                                                                                                                                                                                                   |
| Access hours            | The name of a time range policy object that specifies the times that users are allowed to access the VPN. If you do not specify a time range, users can access the VPN at all times. Specify a time range if you want to limit access to the network to certain hours, such as the typical work days and work hours for your organization.<br><br>Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. For more information, see <a href="#">Configuring Time Range Objects, page 6-66</a> . |
| Max Simultaneous Logins | The number of simultaneous logins a single user is allowed. Values are 0-2147483647. The default is 3. Specify 0 to disable logins and prevent user access.                                                                                                                                                                                                                                                                                                                                                                                     |
| Max Connection Time     | The maximum amount of time a user is allowed to be connected to the VPN. Select one of the following: <ul style="list-style-type: none"> <li>Specified Connection time—Use the maximum time value that you enter. Values are 1-35791394 minutes. After the time is exceeded, the security appliance closes the connection.</li> <li>Unlimited Connection time—The security appliance does not close connections based on connection time.</li> </ul>                                                                                            |
| Idle Timeout            | The amount of time a user is allowed to be connected to the VPN while the connection is idle, that is, there is no communication activity. Select one of the following: <ul style="list-style-type: none"> <li>Specified Timeout—Use the time out value you enter. Values are 1-4473924 minutes. When the idle time is exceeded, the security appliance closes the connection. The default is 30 minutes.</li> <li>Unlimited Timeout—The security appliance does not close idle connections.</li> </ul>                                         |

## Add or Edit Secure Desktop Configuration Dialog Box

Use the Add or Edit Cisco Secure Desktop Configuration dialog box to create, copy, and edit Cisco Secure Desktop Configuration objects for IOS routers. You can configure the settings required for Windows clients who are connecting from different location types, enable or restrict web browsing and file access for Windows CE clients, and configure the cache cleaner for Macintosh and Linux clients.

Cisco Secure Desktop (CSD) secures network endpoints by providing a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system.

This policy object uses the Secure Desktop Manager application to configure the settings. For an example of configuring settings, see *Cisco Secure Desktop on IOS Configuration Example Using SDM* at

[http://www.cisco.com/en/US/products/ps6496/products\\_configuration\\_example09186a008072aa7b.sht](http://www.cisco.com/en/US/products/ps6496/products_configuration_example09186a008072aa7b.sht)

ml. The first part of the configuration example explains setting up SDM, which you can ignore. Instead, look for the sections that describe setting up Windows locations midway through the example. The screen shots will help you identify when you are looking at CSD configuration.

### Navigation Path

Select **Manage > Policy Objects**, then select **Cisco Secure Desktop (Router)** from the Object Type Selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Name                                              | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description                                       | An optional description of the object (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Windows Location Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Windows Locations                                 | <p>The names of the locations that you want to configure for Windows clients connecting from specific locations, such as Work, Home, or Insecure.</p> <p>When you create a location, an item for the location is added to the table of contents, where you can select the settings folders related to the location and configure its properties. The settings include a definition of how to determine if a client is connecting from that particular location.</p> <p>For each location you want to configure, enter its name in the <b>Location to Add</b> field and click <b>Add</b> to move it to the <b>Locations</b> list.</p> <p>You can reorder the locations using the Move Up/Move Down buttons. CSD checks locations in the order listed in this dialog box, and grants privileges to client PCs based on the first location definition they match. You can create a default location, such as Insecure, as the final location and configure the strictest security for it. For more information, see <a href="#">Creating Cisco Secure Desktop Configuration Objects, page 32-18</a>.</p> |
| Close all open browser windows after installation | Whether to close all the open browser windows after installing the Secure Desktop application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 33-15 Add or Edit Secure Desktop Configuration Dialog Box (Continued)**

| Element                                                | Description                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VPN Feature Policy                                     | Select the check boxes to enable these features if installation or location matching fails: <ul style="list-style-type: none"> <li>• Web Browsing</li> <li>• File Access</li> <li>• Port Forwarding</li> <li>• Full Tunneling</li> </ul>                                                                    |
| <b>Windows CE</b>                                      |                                                                                                                                                                                                                                                                                                             |
| VPN Feature Policy                                     | The Windows CE options enable you to configure a VPN feature policy to enable or restrict web browsing and remote server file access for remote clients running Microsoft Windows CE. You cannot configure locations for these clients.                                                                     |
| <b>Mac and Linux Cache Cleaner</b>                     |                                                                                                                                                                                                                                                                                                             |
| Launch Cleanup Upon Global Timeout                     | Whether to set a global timeout after which CSD launches the cache cleaner. Select a timeout (the default is 30 minutes), and select whether to allow the user to reset the timeout value.                                                                                                                  |
| Launch Cleanup Upon Exiting of Browser                 | Whether to start the cache cleaner when the user closes all web browser windows.                                                                                                                                                                                                                            |
| Enable Canceling of Cleaning                           | Whether to allow the remote user to cancel the cleaning of the cache.                                                                                                                                                                                                                                       |
| Secure Delete                                          | The number of passes for CSD to perform a secure cleanup. The default is 1 pass.<br><br>CSD encrypts and writes the cache to the remote client's disk. Upon termination of the Secure Desktop, CSD converts all bits occupied by the cache to all 0's, then to all 1's, and then to randomized 0's and 1's. |
| Enable Web Browsing if Mac or Linux Installation Fails | Whether to allow web browsing (but not other remote access features) if the cache cleaner installation fails.                                                                                                                                                                                               |
| VPN Feature Policy                                     | Whether to allow web browsing, remote server file access, and port forwarding for Macintosh and Linux clients. Port forwarding permits the use of the Secure Desktop to connect a client application installed on the local PC to the TCP/IP port of a peer application on a remote server.                 |
| Category                                               | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                   |

## Add and Edit File Object Dialog Boxes

Use the Add and Edit File Object dialog boxes to create, copy, and edit file objects. File objects represent files that are used in device configurations, typically for remote access VPN policies and policy objects. Such files include Anyconnect client profile and image files, image (graphic) files, plug-in jar files, and Cisco Secure Desktop package files.

When you create a file object, Security Manager makes a copy of the file in its storage system. These files are backed up whenever you create a backup of the Security Manager database, and they are restored if you restore the database. When you deploy configurations that specify a file object, the associated file is download to the device in the appropriate directory.

After you create a file object, you typically should not edit it. If you need to replace the file, edit the file object to select the new file, or create a new file object. If the file is editable, you can edit the file object to identify the file's location in the file repository, and use the desired editor to open and edit the file outside of Security Manager. The file repository is the **CSCOpX\MDC\FileRepository** folder in the installation directory (typically, C:\Program Files). The files are organized in subfolders named for the file type.

For all file types except Image files, you can add a file from the Security Manager server or from the local Security Manager client by selecting the appropriate tab on the Choose a file dialog box. You cannot select files from a network server. You can control the ability to add files from the Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see [Customize Desktop Page, page 11-6](#).

**Tip**

If you are copying a file to the Security Manager server so that it can be used in a file object, do not copy the file directly to the file repository.

When you delete a file object, the associated file is not deleted from the file repository.

**Navigation Path**

Select **Manage > Policy Objects**, then select **File Objects** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

## File Object — Choose a file Dialog Box

Use the File Object — Choose a file dialog box to select the file to use for the file object you are adding or editing. The available files are managed using Image Manager. For more information, see [Image Manager Supported Image Types, page 70-3](#).

**Navigation Path**

Select **Manage > Policy Objects**, then select **File Objects** from the Object Type Selector. Add or Edit a file object and from the Add or Edit File Object dialog box, click **Browse** to open the File Object — Choose a file dialog box.

## Add or Edit Port Forwarding List Dialog Boxes

Use the Port Forwarding List dialog box to create, copy and edit port forwarding list policy objects. You can create port forwarding list objects to use when you are configuring the thin client access mode for SSL VPN.

Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. When port forwarding is enabled, the hosts file on the SSL VPN client is modified to map the application to the port number configured in the forwarding list. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Port Forwarding List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Name                            | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                                                                                                                  |
| Description                     | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Port Forwarding List table      | The port forwarding entries that are defined in the object. The entries show the mapping of the local port to the remote server and port. <ul style="list-style-type: none"> <li>• To add a mapping, click the <b>Add Row</b> button to open the <a href="#">Add or Edit A Port Forwarding Entry Dialog Box, page 33-30</a>.</li> <li>• To edit a mapping, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a mapping, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Include Port Forwarding Lists   | The names of other port forwarding list objects to include in the object. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. Separate multiple entries with commas.<br><br>When you add other port forwarding lists, the entries from those lists are treated as if they were directly entered into this object, and the names of the included objects are not reflected in the device configuration commands during deployment.                   |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                               |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .                                                                                                                                                                                                                                  |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                            |

## Add or Edit A Port Forwarding Entry Dialog Box

Use the Add or Edit A Port Forwarding Entry dialog boxes to create a new port forwarding list entry or edit an existing one.

### Navigation Path

Go to the [Add or Edit Port Forwarding List Dialog Boxes, page 33-28](#) and click the **Add Row** button or select an entry and click the **Edit Row** button beneath the Port Forwarding List table.

### Field Reference

**Table 33-19 Add or Edit A Port Forwarding Entry Dialog Box**

| Element                             | Description                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local TCP Port                      | The port number to which the local application is mapped (between 1 and 65535).                                                                                                                                                                                                                                              |
| Remote Server<br>IP Address<br>Name | The IP address or fully qualified domain name of the remote server. Select the type of entry and enter the IP address or name. For the IP address, you can enter the name of a network/host object that specifies the remote server's IP address, or click <b>Select</b> to select it from a list or to create a new object. |
| Remote TCP Port                     | The port number of the application for which port forwarding is configured (between 1 and 65535).                                                                                                                                                                                                                            |
| Description                         | A description of the port forwarding entry. This information is mandatory on Cisco IOS devices.                                                                                                                                                                                                                              |

## Add or Edit Single Sign On Server Dialog Boxes

Use the Add or Edit Single Sign On Server dialog box to create, copy, and edit single sign on (SSO) server objects for use with SSL VPNs (as configured in ASA group policy objects). For information on how to configure SSO servers in an ASA group policy, see [ASA Group Policies SSL VPN Settings, page 33-17](#).

Single sign-on lets users access different secure services on different servers without entering a username and password more than once. In the authentication, the security appliance acts as a proxy for the SSL VPN user to the SSO server. You can configure this object to identify either a Computer Associates SiteMinder SSO server or a Security Assertion Markup Language (SAML) Browser Post Profile version 1.1 server.

The SSO mechanism starts as part of the AAA process or just after successful user authentication to an AAA server. The SSL VPN server running on the security appliance acts as a proxy for the user to the authenticating server. When a user logs in, the SSL VPN server sends an SSO authentication request, including username and password, to the authenticating server. If the server approves the authentication request, it returns an SSO authentication cookie to the SSL VPN server. The security appliance keeps this cookie on behalf of the user and uses it to authenticate the user to secure web sites within the domain protected by the SSO server.

If you want to configure SSO for an SSL VPN group, you must also configure a AAA server, such as a RADIUS or LDAP server.

**Note**

The SAML Browser Artifact profile method of exchanging assertions is not supported.

**Navigation Path**

Select **Single Sign On Servers** in the [Policy Object Manager, page 6-4](#). Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

You can also create the object when configuring an ASA user group object for SSL VPN (see [ASA Group Policies SSL VPN Settings, page 33-17](#)).

**Field Reference**

**Table 33-20** Add or Edit Single Sign-On Server Dialog Box

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                        | The object name, which must be 4 to 31 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                   |
| Description                                 | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                  |
| Authentication Type                         | The type of SSO server to use with clientless SSL VPN connections. The other attributes on the page change based on your selection. <ul style="list-style-type: none"> <li>• <b>SiteMinder</b>—Computer Associates SiteMinder SSO server.</li> <li>• <b>SAML POST</b>—Security Assertion Markup Language (SAML) Browser Post Profile server.</li> </ul>                                                 |
| URL<br>(SiteMinder only.)                   | The URL of the SiteMinder SSO server to which the security appliance makes authentication requests. Select whether to use HTTP or HTTPS and enter the URL. <p><b>Tip</b> For HTTPS communication, make sure that the SSL encryption settings match on both the security appliance and the SiteMinder server. On the security appliance, you can verify this with the <b>ssl encryption</b> command.</p> |
| Secret Key<br>Confirm<br>(SiteMinder only.) | The key used to encrypt authentication communications with the SiteMinder server, if any. The key can contain any alphanumeric characters. There is no minimum or maximum number of characters. Enter the same key in both fields. <p><b>Tip</b> If you enter a secret key, you must configure the same key in the SiteMinder server using the Cisco Java plug-in authentication scheme.</p>            |
| Assertion URL<br>(SAML POST only.)          | The URL for the SAML-type SSO assertion consumer service. Select whether to use HTTP or HTTPS and enter the URL, which must be fewer than 255 characters.                                                                                                                                                                                                                                               |
| Assertion Issuer<br>(SAML POST only.)       | The name of the security device that is sending assertions to a SAML-type SSO server. This is usually the name of the security appliance, for example, asa.example.com. The name must be fewer than 65 characters.                                                                                                                                                                                      |

**Table 33-20 Add or Edit Single Sign-On Server Dialog Box (Continued)**

| Element                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trustpoint<br>(SAML POST only.)                             | The name of the PKI enrollment policy object that identifies the certificate authority (CA) server that acts as the trustpoint that contains the certificate to use to sign the SAML-type browser assertion. Enter the name or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                     |
| Max Retries                                                 | The number of times the security appliance retries a failed SSO authentication attempt before the authentication times out. The range is 1 to 5 retries, and the default is 3 retries.                                                                                                                                                                                                                                                                                                     |
| Request Timeout                                             | The number of seconds before a failed SSO authentication attempt times out. The range is 1 to 30 seconds, and the default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                    |
| Category                                                    | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device<br>Overrides<br>Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit Bookmarks Dialog Boxes

Use the Add and Edit Bookmarks dialog boxes to configure browser-based clientless SSL VPN bookmarks (URL lists) for an SSL VPN Bookmark object. From this dialog box, you can change the order of the bookmark entries within the table, create, copy, edit, and delete SSL VPN Bookmark objects.

An SSL VPN Bookmark object defines the URLs that are displayed on the portal page after a successful login.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Bookmarks** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

| Name                                       | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description                                | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Bookmarks Heading (IOS) (IOS devices only) | The heading that is displayed above the URLs listed on the portal page of an SSL†VPN hosted on an IOS device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Bookmarks                                  | The list of bookmark entries for the object. <ul style="list-style-type: none"> <li>To change the order of an entry, select it and click the Move Up or Move Down arrow buttons. The order of entries in the table defines the order in which the bookmarks are presented to the user.</li> <li>To add an entry, click the Add button and fill in the Add Bookmark Entry dialog box (see <a href="#">Add and Edit Bookmark Entry Dialog Boxes, page 33-33</a>).</li> <li>To edit an entry, select it and click the Edit button.</li> <li>To delete an entry, select it and click the Delete button.</li> </ul> |
| Category                                   | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Allow Value Override per Device            | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .                                                                                                                                                                                                                                                                                                                                         |
| Overrides                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Edit button                                | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                                                                                   |

## Add and Edit Bookmark Entry Dialog Boxes

Use the Add and Edit Bookmark Entry dialog boxes to create or edit a bookmark to be included in an SSL VPN Bookmark object.

You can use non-English, non-ASCII languages for the text to display for bookmarks if you are configuring the object for use on an ASA device. For more information about how you can configure the SSL VPN portal in local languages, see [Localizing SSL VPN Web Pages for ASA Devices, page 30-68](#).

**Navigation Path**

In the Policy Object Manager, from the [Add or Edit Bookmarks Dialog Boxes](#), right-click inside the Bookmarks table, then select **Add Row** or right-click a row, then select **Edit Row**.

| Post Script     | <p>An optional field for entering JavaScript required by some applications. Some Web applications, such as Microsoft Outlook Web Access, may execute a JavaScript to change the request parameters before the log-on form is submitted.</p>                                                                                                                                                                                                           |

## Add and Edit Post Parameter Dialog Boxes

Use the Add and Edit Post Parameter dialog boxes to create a new Post parameter entry or edit an existing one in the table. For a detailed discussion of Post parameters, see [Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks, page 30-72](#).

### Navigation Path

In the Policy Object Manager, from the [Add and Edit Bookmark Entry Dialog Boxes](#), right-click inside the Post Parameters table, then select **Add Row** or right-click a row, then select **Edit Row**.

| Element | Description                                                                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name    | <p>The name of the post parameter exactly as defined in the corresponding HTML form. For example, <b>param_name</b> in <code>&lt;input name="param_name" value="param_value"&gt;</code>.</p>   |
| Value   | <p>The value of the post parameter exactly as defined in the corresponding HTML form. For example, <b>param_value</b> in <code>&lt;input name="param_name" value="param_value"&gt;</code>.</p> |

# Add and Edit SSL VPN Customization Dialog Boxes

Use the Add and Edit SSL VPN Customization dialog boxes to create, copy, and edit SSL VPN Customization objects. An SSL VPN Customization policy object describes how to customize web pages for a browser-based clientless SSL VPN hosted on an ASA 8.x device. For more information, see [Configuring ASA Portal Appearance Using SSL VPN Customization Objects, page 30-66](#).

You can use non-English, non-ASCII languages for the text to display on these pages. For more information about how you can configure the SSL VPN portal in local languages, see [Localizing SSL VPN Web Pages for ASA Devices, page 30-68](#).

## Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Customization** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

## Field Reference

**Table 33-24 Add and Edit SSL VPN Customization Dialog Boxes**

| Element     | Description                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> . |
| Description | An optional description of the object.                                                                                                                                 |

## Settings Pane

The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right. Before configuring settings, click the Preview button to see the default settings to help you determine what, if anything, you want to change.

The top folders in the table of contents represent the SSL VPN web pages that you can customize, and are explained next.

Table 33-24 Add and Edit SSL VPN Customization Dialog Boxes (Continued)

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logon Page | <p>The Logon web page is the one users see first when connecting to the SSL VPN portal. It is used for logging into the VPN. Select the following items in the Logon Page folder in the table of contents to view and change the settings:</p> <ul style="list-style-type: none"> <li>• <b>Logon Page</b>—The Browser Window Title field defines the title of the web page, which is displayed in the browser’s title bar.</li> <li>• <b>Title Panel</b>—The title displayed in the web page itself. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Title Panel, page 33-39</a>.</li> <li>• <b>Language</b>—The languages you will support for the Logon, Portal, and Logout pages. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Language, page 33-40</a>.</li> <li>• <b>Logon Form</b>—The labels and colors used in the form that accepts user logon information. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Logon Form, page 33-42</a>.</li> <li>• <b>Informational Panel</b>—An extra informational panel for conveying information to users. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Informational Panel, page 33-43</a>.</li> <li>• <b>Copyright Panel</b>—The copyright information on the logon page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Copyright Panel, page 33-44</a>.</li> <li>• <b>Full Customization</b>—If you do not want to use the security appliance’s built-in logon page, even customized, you can instead enable full customization and supply your own web page. For more information about creating a custom Logon page and the settings, see <a href="#">Creating Your Own SSL VPN Logon Page for ASA Devices, page 30-70</a> and <a href="#">SSL VPN Customization Dialog Box—Full Customization, page 33-45</a>.</li> </ul> |

**Table 33-24 Add and Edit SSL VPN Customization Dialog Boxes (Continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Portal Page                     | <p>The Portal web page is the one users see after logging into the SSL VPN; it is the home page. Select the following items in the Portal Page folder in the table of contents to view and change the settings:</p> <ul style="list-style-type: none"> <li>• <b>Portal Page</b>—The <b>Browser Window Title</b> field defines the title of the web page, which is displayed in the browser’s title bar.</li> <li>• <b>Title Panel</b>—The title displayed in the web page itself. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Title Panel, page 33-39</a>.</li> <li>• <b>Toolbar</b>—The toolbar displayed above the main part of the Portal page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Toolbar, page 33-45</a>.</li> <li>• <b>Applications</b>—The application buttons that will appear on the page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Applications, page 33-46</a>.</li> <li>• <b>Custom Panes</b>—The layout of the main part of the Portal page. The default is a single column with no internal panes. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Custom Panes, page 33-46</a>.</li> <li>• <b>Home Page</b>—How and whether to display URL lists on the home page. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Home Page, page 33-48</a>.</li> </ul> |
| Logout Page                     | <p>The Logout web page is the one users see after logging out of the SSL VPN. For more information about the settings, see <a href="#">SSL VPN Customization Dialog Box—Logout Page, page 33-49</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category                        | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Allow Value Override per Device | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Edit button                     | <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## SSL VPN Customization Dialog Box—Title Panel

Use the Title Panel page of the SSL VPN Customization dialog box to determine whether the Logon page or Portal page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic.

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Title Panel** in the table of contents to configure the title of the Logon page, or **Portal Page > Title Panel** to configure the title of the Portal page.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Display Title Panel | Whether to display a title panel within the web page. The default is to not display a title. If you select this option, you can configure the title using the other fields on this page.                                                                                                                                                                                                                                                               |
| Gradient            | Whether to have the background color change in a gradual progression.                                                                                                                                                                                                                                                                                                                                                                                  |
| Title Text          | The text to display in the title panel.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Font Weight         | The characteristics of the font used for the title text. You can select a weight, font size, and color. Click <b>Select</b> to choose a font color.                                                                                                                                                                                                                                                                                                    |
| Font Size           |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Font Color          |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Background Color    | The color of the background of the title panel. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                                 |
| Style (CSS)         | Cascading Style Sheet (CSS) parameters that define the style characteristics of the title panel. You can include a maximum of 256 characters.<br><br><b>Tip</b> For more information about CSS, visit the World Wide Web Consortium (W3C) website at <a href="http://www.w3.org">www.w3.org</a> .                                                                                                                                                      |
| Logo Image          | The File policy object that identifies the logo image you want to include in the title panel, if any. Enter the name of the File object or click <b>Select</b> to select it from a list or to create a new object.<br><br><b>Tip</b> The image file can be a GIF, JPG, or PNG file, and it can be up to 100 kilobytes in size.<br><br>For more information about File objects, see <a href="#">Add and Edit File Object Dialog Boxes, page 33-25</a> . |

## SSL VPN Customization Dialog Box—Language

Use the Language page of the SSL VPN Customization dialog box identify the languages you will support on the browser-based clientless SSL VPN portal. If you want to configure translation tables for other languages on the ASA device and use them, you can configure the supported languages and allow users to choose their language. Before you configure these settings, read [Localizing SSL VPN Web Pages for ASA Devices, page 30-68](#).

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Language** in the table of contents.

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Automatic Browser Language Selection | <p>This table lists the languages you will support on the web pages for automatic browser language selection. Automatic browser language select allows the ASA device to negotiate with the user's web browser to determine the language in which to present the web pages. You must configure a translation table on the ASA device for any language you list here. For more detailed information about automatic browser language selection, see <a href="#">Localizing SSL VPN Web Pages for ASA Devices, page 30-68</a>.</p> <p>Languages are listed by their abbreviation in the table. The languages are evaluated top to bottom until a match is found. The language that is indicated as the default language (indicated as True in the table) is used if the device is unable to negotiate a different language with the browser. If you do not specify a default, English is the default.</p> <ul style="list-style-type: none"> <li>• To add a language, click the Add Row button below the table.</li> <li>• To edit a language, select it and click the Edit Row button.</li> <li>• To delete a language, select it and click the Delete Row button.</li> </ul> |
| Enable Language Selector             | <p>Whether to display the Language Selector on the Logon page. The Language Selector allows users to select their preferred language. The Language Selector is complementary to the automatic browser language selection capability.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Language Selector Prompt             | <p>The text label for the Language Selector prompt.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Language Table                       | <p>The list of languages included in the Language Selector drop-down list. You must configure a translation table on the ASA device for any language you list here. For more detailed information, see <a href="#">Localizing SSL VPN Web Pages for ASA Devices, page 30-68</a>.</p> <p>The table lists the languages by abbreviation and title, or the common name of the language. The title is the text displayed in the drop-down list. You can change the language title but not the abbreviation.</p> <ul style="list-style-type: none"> <li>• To add a language, click the Add Row button below the table.</li> <li>• To edit a language, select it and click the Edit Row button.</li> <li>• To delete a language, select it and click the Delete Row button.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |

## Add and Edit Language Dialog Boxes

Use the Add and Edit Language dialog boxes to add or edit an entry for a language you will support for automatic browser language selection or in the Language Selector drop-down list.

### Navigation Path

From the [SSL VPN Customization Dialog Box—Language](#) page, click the **Add Row** button for either the Automatic Browser Language Selection table or the Language Selector table, or select a row and click the **Edit Row** button.

|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message                                                | The message that appears in the login box above the username and password fields. You can enter a maximum of 256 characters.                                                                                                                                                                                                                                                                                                              |
| Username Prompt                                        | The text of the prompt for the username entry field.                                                                                                                                                                                                                                                                                                                                                                                      |
| Password Prompt                                        | The text of the prompt for the password entry field.                                                                                                                                                                                                                                                                                                                                                                                      |
| Secondary Username Prompt<br>Secondary Password Prompt | The prompts for a second username and password if you require two login credentials. You can enable secondary authentication only if the Connection Profile policy is configured to require it.<br><br>The secondary username and password prompt are displayed only if you configure them. If you leave the username prompt blank, the primary username is used and the secondary password must be associated with the primary username. |
| Internal Password Prompt                               | The text of the prompt for the internal password entry field.                                                                                                                                                                                                                                                                                                                                                                             |
| Show Internal Password First                           | Whether the prompt for the internal password should be placed above the password prompt. The internal password is required when using a clientless SSL VPN to access an internal protected website.                                                                                                                                                                                                                                       |
| Group Selector Prompt                                  | The text of the prompt for the Group Selector drop-down list.                                                                                                                                                                                                                                                                                                                                                                             |
| Button Text                                            | The name of the button the user clicks to log onto the SSL VPN.                                                                                                                                                                                                                                                                                                                                                                           |
| Border Color                                           | The color of the border of the login box. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                          |
| Title Font Color                                       | The color of the font for the login box title. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                     |
| Title Background Color                                 | The background color for the Title area of the login box. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                          |
| Font Color                                             | The color of the font of the login form. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                           |
| Background Color                                       | The background color for the login form. Click <b>Select</b> to choose a color.                                                                                                                                                                                                                                                                                                                                                           |

## SSL VPN Customization Dialog Box—Informational Panel

Use the Informational Panel page of the SSL VPN Customization dialog box to customize the appearance of the Informational panel in the Logon page. The Informational panel is an area where you can provide extra information to the user, and is optional.

### Navigation Path

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logon Page > Informational Panel** in the table of contents.

| Element                   | Description                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Full Customization | Whether you want to use your own custom Logon page. If you enable full customization, all of the other Logon page configuration settings are ignored.                                                                                                                                |
| Custom Page               | The custom Logon page. You must copy the file to the Security Manager server before specifying it here. Click <b>Browse</b> to select the file. For information on selecting files, see <a href="#">Selecting or Specifying a File or Directory in Security Manager, page 1-47</a> . |

## SSL VPN Customization Dialog Box—Toolbar

Use the Toolbar page of the SSL VPN Customization dialog box to customize the appearance of the toolbar in the Portal page. The toolbar appears above the main body of the Portal page and includes a field to allow users to enter URLs to browse. The toolbar is optional.

### Navigation Path

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Portal Page > Toolbar** in the table of contents.

| No.                                             | The sequential number of the application in the table. To change the order of an application, select it and click the Move Up or Move down buttons to the desired position. The applications appear on the Portal page in the order represented here.                                                                                                                            |
| Move Up and Move Down buttons (below the table) |                                                                                                                                                                                                                                                                                                                                                                                  |
| Application                                     | The graphic associated with an application.                                                                                                                                                                                                                                                                                                                                      |
| Title                                           | The name of the application. Standard applications include Home, Web Applications, Browse Networks, Application Access, and AnyConnect Client. Also listed are the browser plug-ins that you create when you configure the SSL VPN global settings are also available for selection from this page.<br>Double-click a title to make it editable so that you can change the name. |
| Enable                                          | Whether the application is included on the Portal page.                                                                                                                                                                                                                                                                                                                          |
| Show Navigation Panel                           | Whether to display the navigation panel in the portal page. If you deselect this option, the list of applications does not appear on the portal.                                                                                                                                                                                                                                 |

## SSL VPN Customization Dialog Box—Custom Panes

Use the Custom Panes page of the SSL VPN Customization dialog box to customize the appearance of the main body of the Portal page. By creating custom panes and specifying a column layout, you can create a grid of information that can help you present portal information effectively to your end users.

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Portal Page > Custom Panes** in the table of contents.

**Related Topics**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Columns table      | <p>The list of columns that the main body of the Portal page should be divided into. You define the column based on a percentage of the width of the page. The percentages should add up to 100. If they do not add up to 100, the device will adjust the column widths.</p> <p>Create the columns as you want them to appear, left to right, on the Portal page.</p> <ul style="list-style-type: none"> <li>• To add a column, click the Add Row button below the table.</li> <li>• To edit a column, select it and click the Edit Row button.</li> <li>• To delete a column, select it and click the Delete Row button.</li> </ul>                                                                                                  |
| Custom Panes table | <p>The custom panes that should appear in the main body of the Portal page. The table shows whether a pane is enabled to appear, the type of pane, its characteristics, and the column and row in which it will appear on the page. The panes can display plain text or include a URL for HTML, image, or RSS links.</p> <p>For more detailed information about the settings, see <a href="#">Add or Edit Custom Pane Dialog Boxes, page 33-47</a>.</p> <ul style="list-style-type: none"> <li>• To add a custom pane, click the Add Row button below the table.</li> <li>• To edit a custom pane, select it and click the Edit Row button.</li> <li>• To delete a custom pane, select it and click the Delete Row button.</li> </ul> |

## Add and Edit Column Dialog Boxes

Use the Add or Edit Column dialog box to create or edit columns in the main body of the Portal page for browser-based clientless SSL VPNs. Enter the desired width of the column as a percentage of the total area in the Percentage field.

**Navigation Path**

From the [SSL VPN Customization Dialog Box—Custom Panes](#) page, click the **Add Row** button in the Column table, or select a column and click the **Edit Row** button.

## Add or Edit Custom Pane Dialog Boxes

Use the Add or Edit Custom Pane dialog box to create or edit a pane to display in the main body or the Portal page of a browser-based clientless SSL VPN.

**Navigation Path**

From the [SSL VPN Customization Dialog Box—Custom Panes](#) page, click the **Add Row** button in the Custom Pane table, or select a pane and click the **Edit Row** button.

**Field Reference****Table 33-35 Add and Edit Custom Pane Dialog Boxes**

| Element                                     | Description                                                                                                                                                                                                                                                                            |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable                                      | Whether to display the custom pane on the Portal page.                                                                                                                                                                                                                                 |
| Type                                        | The type of content to show in the pane, one of: <ul style="list-style-type: none"> <li>Text—Plain text. You can include HTML mark up.</li> <li>HTML—HTML content provided by a URL.</li> <li>Image—An Image provided by a URL.</li> <li>RSS—An RSS feed provided by a URL.</li> </ul> |
| Show Title<br>Title                         | Whether to display a title in the pane. If you select this option, enter the title in the Title field.                                                                                                                                                                                 |
| Show Border                                 | Whether to display a border around the pane.                                                                                                                                                                                                                                           |
| Column<br>Row                               | The column and row numbers in which the pane should appear. Select or enter the number for each to specify the desired grid location.                                                                                                                                                  |
| Height                                      | The height of the pane in pixels.                                                                                                                                                                                                                                                      |
| URL<br>(HTML, Image, and RSS content only.) | The URL that hosts the content you want to display in the pane.                                                                                                                                                                                                                        |
| Text<br>(Text content only.)                | The text you want to display in the pane. You can include HTML markup in the text.                                                                                                                                                                                                     |

## SSL VPN Customization Dialog Box—Home Page

Use the Home Page page in the SSL VPN Customization dialog box to customize the appearance of the URL and file lists on the Portal page and the content of the main body of the Portal page. URL lists are considered to be default elements on the portal home page unless they are explicitly disabled.

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Portal Page > Home Page** in the table of contents.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Custom Intranet Web Page | Whether to display a custom Intranet web page, which also enables URL bookmarks to be displayed on the Portal page. If you select this option, you can configure the panel using the other fields on this page.                                                                                                                                                                                                                                                                                                               |
| URL List Mode                   | How you want to display URL lists on the home page. If you display URL lists, they are displayed in the column cells that are not occupied by custom panes (as configured on Portal Page > Custom Panes). The options are: <ul style="list-style-type: none"> <li>• <b>Group By Application</b>—Bookmarks are grouped by application type. For example, Web Bookmarks, File Bookmarks.</li> <li>• <b>No Group</b>—URL lists are shown as separate panes.</li> <li>• <b>Do Not Display</b>—URL lists are not shown.</li> </ul> |
| Custom Intranet Web Page URL    | The URL of the custom web page that you want to be loaded as the home page. This page is displayed in the main body of the Portal page.<br><br>If you specify a custom page, the settings on the Custom Panes page are ignored, and bookmark lists appear on the application pages that are accessed through the navigation panel on the left of the Portal page.                                                                                                                                                             |

## SSL VPN Customization Dialog Box—Logout Page

Use the Logout Page page of the SSL VPN Customization dialog box to customize the appearance of the Logout page for browser-based clientless SSL VPNs. The Logout page appears after the user logs out of the VPN.

**Navigation Path**

From the [Add and Edit SSL VPN Customization Dialog Boxes](#), select **Logout Page** in the table of contents.

| Font Color<br>Background Color             | The font and background color of the message that appears in the logout box. Click <b>Select</b> to choose a color. |

## Add or Edit SSL VPN Gateway Dialog Box

Use the Add or Edit SSL VPN Gateway dialog box to create, copy and edit SSL VPN gateway objects. You use these objects when you are configuring an SSL VPN connection on an IOS device. For more information, see [SSL VPN Configuration Wizard—Gateway and Context Page \(IOS\)](#), page 29-32.

An SSL VPN gateway acts as a proxy for connections to protected resources that are accessed through an SSL-encrypted connection between the gateway and a web-enabled browser on a remote device. You can configure only one gateway per SSL VPN.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Gateway** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     |                                                                                                                                                                                                                                                                        |
|                                 | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Add and Edit Smart Tunnel List Dialog Boxes

Use the Add and Edit Smart Tunnel Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel objects.

An SSL VPN smart tunnel list object lists the applications that are eligible for smart tunnel access to a private site. You can configure the clientless settings of an ASA group policy with a smart tunnel list to allow users to access the specified applications through the SSL VPN portal. For an explanation of the types of applications that support smart tunnel access, see [Configuring SSL VPN Smart Tunnels for ASA Devices, page 30-73](#).

You can include other SSL VPN smart tunnel list objects in an object. Thus, you can create a smaller set of objects that identify your basic list of applications, then create other objects that create the required combination of applications. For example, you might want all three of your ASA group policies to allow smart tunnel access to applications A and B, but the remaining applications are unique for each group. By creating a single object that specifies A and B, you can include that object in each of the SSL VPN smart tunnel list objects for the group policies, and these objects need only specify their unique applications in the applications table.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smart Tunnel Entries table      | <p>The applications to which users will be allowed smart tunnel access through the SSL VPN, including the name of the application and its location on client workstations.</p> <ul style="list-style-type: none"> <li>To add an application, click the <b>Add Row</b> button to open the <a href="#">Add and Edit A Smart Tunnel Entry Dialog Boxes, page 33-53</a>.</li> <li>To edit an application, select it and click the <b>Edit Row</b> button.</li> <li>To delete an application, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Include Smart Tunnel Lists      | The other SSL VPN smart tunnel list objects that you want to include in this object, if any. Enter the names of the objects or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.                                                                                                                                                                                                                                                                                                        |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .                                                                                                                                                                                                                                                                                |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                                                                                                                                          |

## Add and Edit A Smart Tunnel Entry Dialog Boxes

Use the Add and Edit A Smart Tunnel Entry dialog boxes to create a new smart tunnel entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Lists dialog box.

### Navigation Path

From [Add and Edit Smart Tunnel List Dialog Boxes, page 33-52](#), click the **Add Row** button beneath the Smart Tunnel Entries table, or select an entry and click the **Edit Row** button.

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hash Value | <p>(Optional) The hash value for the application. By specifying a hash value, you can ensure that the user does not rename another application to use a supported filename and thus start an unsupported and undesired application over the smart tunnel.</p> <p>To obtain the hash value, enter the checksum of the application (that is, the checksum of the executable file) into a utility that calculates a hash using the SHA-1 algorithm. One example of such a utility is the Microsoft File Checksum Integrity Verifier (FCIV), which is available at <a href="http://support.microsoft.com/kb/841290/">http://support.microsoft.com/kb/841290/</a>. Place a temporary copy of the application to be hashed on a path that contains no spaces (for example, c:\temp) and then enter <b>fciv.exe -sha1</b> application at the command line (for example, <b>fciv.exe -sha1 c:\msimn.exe</b>) to display the SHA-1 hash. Copy and paste the value into this field.</p> <p>The SHA-1 hash is always 40 hexadecimal characters. Before authorizing an application for smart tunnel access, clientless SSL VPN calculates the hash of the application matching the App Name. It qualifies the application for smart tunnel access if the result matches the value of hash.</p> <p>Because the checksum varies with each version or patch of an application, the hash you enter can match only one version or patch on the remote host. To specify a hash for more than one version of an application, create a unique smart tunnel entry for each hash value.</p> <p><b>Tip</b> Hash values require maintenance. You must update the smart tunnel list if you want to support future versions or patches of an application for which you supply a hash value. A sudden problem with smart tunnel access might be an indication that the application list containing hash values is not up-to-date with an application upgrade. You can avoid this problem by not entering a hash.</p> |

## Add and Edit Smart Tunnel Auto Signon List Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel auto sign-on objects.

Smart Tunnel Auto Sign-on is a single sign-on method for Clientless SSL VPN users. It passes the login credentials (username and password) to internal servers for authentication using NTLM authentication, HTTP Basic authentication, or both. Smart Tunnel Auto Sign-on is supported on ASA 5500 devices running software version 7.1(1) and later.

An SSL VPN smart tunnel auto sign-on list object identifies the servers for which to automate the submission of login credentials during smart tunnel setup. You can configure the clientless settings of an ASA group policy with a smart tunnel auto sign-on list if you want to reissue the user credentials when the user establishes a smart tunnel connection to a server. For an explanation of the types of applications that support smart tunnel access, see [Configuring SSL VPN Smart Tunnels for ASA Devices, page 30-73](#).

You can include other SSL VPN smart tunnel auto sign-on list objects in an object. Thus, you can create a set of objects that identify your basic list of servers and include those objects in another object that expands upon that list of servers.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Auto Signon Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Description                                           | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Smart Tunnel Auto Signon Entries table                | The servers for which to automate the submission of login credentials during smart tunnel setup. <ul style="list-style-type: none"> <li>• To add servers, click the <b>Add Row</b> button to open the <a href="#">Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes, page 33-56</a>.</li> <li>• To edit an entry, select it and click the <b>Edit Row</b> button.</li> <li>• To delete an entry, select it and click the <b>Delete Row</b> button.</li> </ul>                       |
| Include Other Lists                                   | The other smart tunnel auto sign-on list objects that you want to include in this object, if any. Enter the names of the objects or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.                                                                                                                                                                                                                                        |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Entry dialog boxes to create a new smart tunnel entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Auto Signon List dialog box.

**Navigation Path**

From [Add and Edit Smart Tunnel Auto Signon List Dialog Boxes, page 33-55](#), click the **Add Row** button beneath the Smart Tunnel Auto Signon Entries table, or select an entry and click the **Edit Row** button.

| Matching Mode: <ul style="list-style-type: none"> <li>• Host</li> <li>• IP Address</li> </ul> | Identifies the server for which to automate the submission of login credentials during smart tunnel setup. Use Host to specify the server by host name or wildcard mask, and use IP Address to specify the server by IP address and netmask: <ul style="list-style-type: none"> <li>• <b>Host</b>—Select Host and then enter the host name or a wildcard mask in the Hostname Mask field that identifies the host for which to automate the submission of login credentials during smart tunnel setup.</li> </ul> <p><b>Note</b> Using this option protects the configuration from dynamic changes to IP addresses.</p> <ul style="list-style-type: none"> <li>• <b>IP Address</b>—Select IP Address and then enter the IP address and netmask of the host or sub-network of hosts for which to automate the submission of login credentials during smart tunnel setup.</li> </ul> <p><b>Note</b> Firefox requires the administrator to specify hosts using an exact host name or IP address (instead of a host mask with wild cards, a subnet using IP addresses, or a netmask). For example, within Firefox, you cannot enter *.cisco.com and expect auto sign-on to host email.cisco.com.</p> |
| Port Number                                                                                   | The port that performs auto sign-on. For Firefox, if no port number is specified, auto sign-on is performed on HTTP and HTTPS, accessed by default port numbers 80 and 443 respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Authentication Realm                                                                          | The realm for the authentication. The Authentication Realm is associated with the protected area of the website and is passed back to the browser either in the authentication prompt or in the HTTP headers during authentication. After auto sign-on is configured and a realm string is specified, users can configure the realm string on a web application (such as Outlook Web Access) and access web applications without signing on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use Domain                                                                                    | Select this option to add the Windows domain to the username if authentication requires it. If you use this option, be sure to specify the domain name when assigning the smart tunnel list to one or more group policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Add or Edit User Group Dialog Box

Use the Add or Edit User Group dialog box to create or edit a user group object. User group objects are used in Easy VPN topologies, remote access VPNs, and SSL VPNs for IOS devices.

When you configure a remote access VPN, SSL VPN, or Easy VPN server, you can create user groups to which remote clients belong. The remote clients must be configured with the same group name as the user group on the VPN server in order to connect to the server; otherwise, no connection is established. When the remote client connects to the VPN server successfully, the group policies for that particular user group are pushed to all remote clients belonging to the user group.

For more information about user groups, see:

- [Configuring User Group Policies, page 32-13](#)
- [Configuring a User Group Policy for Easy VPN, page 27-14](#)
- [Configuring an SSL VPN Policy \(IOS\), page 32-14](#)

## Note

You must select the technology (Easy VPN/Remote Access VPN, or SSL VPN) for which you are creating the user group object. If you are editing an existing user group object, the technology is already selected and you cannot change it. Depending on the selected technology, the appropriate settings are available for configuration.

## Navigation Path

Select **Manage > Policy Objects**, then select **User Groups** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

## Tip

You can also access this dialog box from the **Remote Access VPN > IPSec VPN > User Groups** or the **Remote Access VPN > SSL VPN** policies.

## User Group Dialog Box—General Settings

The general settings you configure for your user group include the authentication method, IP address pool information, and connection attributes for PIX 6.3 Firewalls.

### Note

These settings apply in Easy VPN and remote access IPsec VPN configurations.

### Navigation Path

Select **General** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

### Field Reference

**Table 33-44** User Group Dialog Box—General Settings

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preshared Key                 | <p>The preshared key that will be used to authenticate the clients associated to the user group.</p> <p><b>Note</b> You do not have to enter a preshared key if you are using digital certificates for group authentication.</p> <p>In regular IPsec VPNs, preshared keys allow for one or more peers to use individual shared secrets to authenticate encrypted tunnels. A preshared key must be configured on each participating peer. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.</p> <p>In Easy VPN authentication, the same Easy VPN server key is used for the spoke configuration to ensure that the server/client keys match.</p> <p>In remote access IPsec VPN authentication, the same key is used to negotiate a VPN connection between the remote access VPN server and the remote clients.</p> |
| IP Address Pool Subnet/Ranges | The IP address ranges for a local pool that will be used to allocate an internal IP address to a client. Remote clients are assigned IP addresses from this pool. Separate multiple entries with commas. The default is 172.16.0.1-172.16.4.254.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Backup Servers IP Address     | The IP address of the servers to be used as backups for the Easy VPN or remote access IPsec VPN server. The router tries to connect to these servers if the primary connection to the Easy VPN or remote access VPN server fails. Separate multiple entries with commas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 33-44** User Group Dialog Box—General Settings (Continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PIX Only Attributes | <p>These attributes apply only to PIX 6.3 devices.</p> <ul style="list-style-type: none"> <li>• <b>Idle Time</b>—The timeout period for VPN connections, in seconds. If no communication occurs on the connection during this period, the device terminates the connection. The minimum is 60 seconds, and the maximum time is 35791394 minutes. The default is 30 minutes.</li> <li>• <b>Max Time</b>—The maximum amount of time for VPN connections, in seconds. At the end of the time, the device terminates the connection. The minimum is 60 seconds, and the maximum is 35791394 minutes. There is no default.</li> </ul> |

## User Group Dialog Box—DNS/WINS Settings

Configure the DNS/WINS settings for your user group to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the user group.

### Note

The DNS/WINS settings you configure for a user group apply in Easy VPN, remote access VPN, and SSL VPN configurations.

### Navigation Path

Select **DNS/WINS** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

### Field Reference

**Table 33-45** User Group Dialog Box—DNS/WINS Settings

| Element               | Description                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary DNS Server    | The IP address of the primary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.   |
| Secondary DNS Server  | The IP address of the secondary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. |
| Domain Name           | The domain name of the DNS server you want to configure on the user group.                                                                                                                             |
| Primary WINS Server   | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |
| Secondary WINS Server | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |

## User Group Dialog Box—Split Tunneling

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination.

The split tunneling policy is applied to a specific network. When you configure split tunneling, you can transmit both secured and unsecured traffic on the same interface. You must specify which traffic will be secured and what the destination of that traffic is, so that you have a secure tunnel to the central site, while the clear (unsecured) traffic is transmitted across the public network.

### Tip

For optimum security, we recommend that you not enable split tunneling.

### Note

Split tunneling can be applied in Easy VPN, remote access VPN, and SSL VPN configurations. For information about configuring split tunneling for SSL VPN, see [User Group Dialog Box—SSL VPN Split Tunneling, page 33-70](#).

### Navigation Path

Select **Split Tunneling** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#) when configuring Easy VPN/Remote Access IPsec VPN.

### Field Reference

**Table 33-46** *User Group Dialog Box—Split Tunneling*

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split Tunneling | <p>The networks for which you want to tunnel traffic. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. You can identify the networks using one of these options:</p> <ul style="list-style-type: none"> <li>• <b>Protected Networks</b>—Specify the networks by network addresses. Enter the addresses or network/host objects, or click <b>Select</b> to select the objects from a list or to create new objects. For information on specifying addresses, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a>.</li> <li>• <b>ACL</b>—Specify the networks using an extended access control list policy object. Enter the name of the object or click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> |
| Split DNS       | <p>A list of domain names that must be tunneled or resolved to the private network. All other names will be resolved through the public DNS server.</p> <p>You can enter multiple domain names separated by commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## User Group Dialog Box—IOS Client Settings

Configure IOS client settings to define Cisco IOS specific options for your user group, including firewall settings for VPN clients.

### Note

These settings apply in Easy VPN and remote access IPsec VPN configurations.

### Navigation Path

Select **Client Settings (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

### Field Reference

**Table 33-47** *User Group Dialog Box—Client Settings (IOS)*

| Element                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Firewall Are-You-There<br>(Not available on 7600 series or ASR routers.) | This feature may be used if a VPN client is running the Black Ice or Zone Alarm personal firewall.<br><br>When selected, it ensures that the personal firewall is running at connection time and throughout the connection. The Firewall-Are-U-There attribute is sent by the Black Ice and Zone Alarm personal firewalls if the server prompts them to do so. If the personal firewall stops running, the connection is terminated. If this feature is enabled and there is no personal firewall running on the server, the connection is never established.                                                                                                                                                                                                                                  |
| Mode                                                                            | A Central Policy Push (CPP) firewall policy on a server allows or denies a tunnel on the basis of whether the remote device has a required firewall for a local AAA server.<br><br>The Mode option specifies whether the Central Policy Push (CPP) policy is optional or mandatory, as follows: <ul style="list-style-type: none"> <li>• <b>Optional</b>—If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy.</li> <li>• <b>Required</b>—If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms this policy. Otherwise, the tunnel is terminated.</li> </ul> |
| Firewall Type                                                                   | The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco and Zone Labs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 33-47** User Group Dialog Box—Client Settings (IOS) (Continued)

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy Type             | Specifies the CPP firewall policy type: <ul style="list-style-type: none"> <li>• <b>Check Presence</b>—Instructs the server to check for the presence of the specified firewall type.</li> <li>• <b>Central Policy Push</b>—The actual policy, such as the input and output access lists, that must be applied by the specified client firewall type. Specify the following: <ul style="list-style-type: none"> <li>– The access control list to be used. Enter the name of the extended ACL object or click <b>Select</b> to select it from a list or to create a new object.</li> <li>– The direction of the access control list—Inbound or Outbound.</li> </ul> </li> </ul> |
| Include Local LAN       | Whether to allow a non split-tunneling connection to access the local LAN at the same time as the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Perfect Forward Secrecy | Whether to enable Perfect Forward Secrecy (PFS). If PFS is enabled, the server is configured to notify the client of the central-site policy about whether PFS is required for any IPsec SA. The Diffie-Hellman (D-H) group that is proposed for PFS is the same that was negotiated in Phase 1 of the IKE negotiation.                                                                                                                                                                                                                                                                                                                                                        |

## User Group Dialog Box—IOS Xauth Options

IOS Xauth options configure IKE Extended Authentication (Xauth) user authentication and connection parameters for the user group, including the banner text.

### Note

These settings apply in Easy VPN and remote access VPN configurations.

### Navigation Path

Select **Xauth Options (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

### Field Reference

**Table 33-48** User Group Dialog Box—IOS Xauth Options

| Element                 | Description                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Banner                  | The banner text that is displayed to Easy VPN remote clients during Xauth and web-based activation the first time the Easy VPN tunnel is brought up. A maximum of 1024 characters is allowed. |
| Maximum Logins Per User | The maximum number of connections a user can establish simultaneously. The maximum is 10.                                                                                                     |
| Maximum Connections     | The maximum number of client connections to the Easy VPN Server from this group. The maximum is 5000 per group.                                                                               |

**Table 33-48** User Group Dialog Box—IOS Xauth Options (Continued)

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Group-Lock    | <p>Whether to enable group lock, which requires that the user enter the extended Xauth username in one of the following formats:</p> <ul style="list-style-type: none"> <li>• username/groupname</li> <li>• username\groupname</li> <li>• username@groupname</li> <li>• username%groupname</li> </ul> <p>The group that is specified after the delimiter is then compared to the group identifier that is sent during IKE aggressive mode. The groups must match or the connection is rejected.</p> <p><b>Note</b> Do not select this option if you are using RSA signature authentication mechanisms such as certificates.</p> |
| Enable Save Password | <p>Whether to allow users to save their Xauth password locally on the client. On subsequent authentications, users can activate the password by using the check box on the software client or by adding the username and password to the Cisco IOS hardware client profile. After users activate the password, their username and password are sent to the server automatically during Xauth.</p> <p>This option is useful only if users have static passwords, that is, they are not one-time passwords such as those that are generated by a token.</p>                                                                       |

## User Group Dialog Box—IOS Client VPN Software Update

Client VPN Software Update (IOS) settings configure, for an IOS VPN client, the platform type, VPN Client revisions, and image URL for each client VPN software package installed, for your user group.

The Client Update feature is supported on IOS routers version 12.4(2)T and later, and Catalyst 6500/7600 devices version 12.2(33)SRA and later.

- To add a client, click the **Add Row** button to open the [Add/Edit Client Update Dialog Box](#), page 33-65.
- To edit a client, select it and click the **Edit Row** button.
- To delete a client, select it and click the **Delete Row** button.

**Note**

These settings apply in Easy VPN and remote access VPN configurations.

**Navigation Path**

Select **Client VPN Software Update (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box](#), page 33-58.

### Add/Edit Client Update Dialog Box

Use the Add or Edit Client Update dialog box to configure the platform type, image URL, and VPN Client revisions for a client VPN software package.

**Navigation Path**

Open the [User Group Dialog Box—IOS Client VPN Software Update](#), page 33-65, then click **Add Row**, or select an item in the table and click **Edit Row**.

**Related Topics**

- [Add or Edit User Group Dialog Box](#), page 33-58

**Field Reference**

**Table 33-49** *Add or Edit Client Update Dialog Box*

| Element                  | Description                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Type              | The platform on which the IOS VPN client operates. <ul style="list-style-type: none"> <li>• All Windows (Default)—This option includes any Windows platform for which a VPN client is available.</li> <li>• Macintosh OS X</li> </ul> |
| IOS Image URL            | Enter the URL from where the client can be downloaded. The URL must start with http:// or https://.                                                                                                                                   |
| IOS VPN Client Revisions | Enter the revision level of the VPN client. You can specify more than one client revision separated by commas.                                                                                                                        |

## User Group Dialog Box—Advanced PIX Options

The Advanced PIX Options are specifically for PIX 6.3 Firewalls in your user group.

**Note**

These settings apply in Easy VPN and remote access VPN configurations.

**Navigation Path**

Select **Advanced Options (PIX)** from the table of contents in the [Add or Edit User Group Dialog Box](#), page 33-58.

**Field Reference**

**Table 33-50** *User Group Dialog Box—Advanced PIX Options*

| Element                    | Description                                                                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Idle Timeout (sec)    | The length of time that a VPN tunnel can remain open without user activity, in seconds. Values range from 60-86400 seconds.                                                                                                                                               |
| User Authentication Server | The AAA server to which remote devices send user authentication requests. Enter the name of the server group or click <b>Select</b> to select it from a list or to create a new group. See <a href="#">Understanding AAA Server and Server Group Objects</a> , page 6-24. |

**Table 33-50** *User Group Dialog Box—Advanced PIX Options (Continued)*

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Device Pass-Through        | <p>Whether to use Media Access Control (MAC) addresses to bypass authentication for devices, such as Cisco IP phones, that do not support AAA authentication.</p> <p>When MAC-based AAA exemption is enabled, the device bypasses the AAA server for traffic that matches both the MAC address of the device and the IP address that was dynamically assigned by a DHCP server. Authorization services are disabled automatically when you bypass authentication. Accounting records continue to be generated (if enabled), but the username is not displayed.</p> |
| Enable Secure Unit Authentication | <p>Whether to provide increased security when allowing access to the device from a remote client.</p> <p>With Secure Unit Authentication (SUA), you can use one-time passwords, two-factor authentication, and similar authentication schemes to authenticate the remote device during Extended Authentication (Xauth).</p> <p>SUA is specified in the VPN policy on the device and is downloaded to the remote client. This enables SUA and determines the connection behavior of the remote client.</p>                                                          |
| Enable User Authentication        | <p>Whether to enable Individual User Authentication (IUA), which supports individually authenticating clients on the inside network of the remote access VPN, based on the IP address of each inside client. IUA supports both static and OTP authentication mechanisms.</p>                                                                                                                                                                                                                                                                                       |

## User Group Dialog Box—Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in an SSL VPN.

In clientless access mode, once a user is authenticated and a session is established, an SSL VPN portal page and toolbar is displayed on the user's web browser. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers.

### Navigation Path

Select **Clientless** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

| Portal Page Websites                      | The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Allow Users to Enter Websites             | Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Common Internet File System (CIFS) | In Clientless mode, files and directories created on Microsoft Windows servers can be accessed by the remote client through the web browser. When you enable the Common Internet File System (CIFS), a list of file server and directory links are displayed on the portal page after login.<br><br>The CIFS protocol lets you customize permissions on the SSL VPN gateway to allow shared files to be accessed or modified by the remote client, as follows: <ul style="list-style-type: none"> <li>• <b>Enable File Browsing</b>—Whether to allow the remote user to browse for file shares on the CIFS file servers.</li> <li>• <b>Enable File Entry</b>—Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.</li> </ul> |
| WINS Server List                          | The name of the WINS server list policy object that identifies the WINS/NetBIOS servers to use for resolving file server names. You should supply an object if you enable CIFS. Enter the name of the object or click <b>Select</b> to select if from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Citrix                             | Whether to enable remote clients to run Citrix-enabled applications, such as Microsoft Word or Excel, through the SSL VPN as if the application were locally installed, without the need for client software. The Citrix software must be installed on one or more servers on a network that the router can reach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## User Group Dialog Box—Thin Client Settings

Use the Thin Client settings to enable the thin client, or port forwarding, mode of access to the corporate network in an SSL VPN. Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

In thin client access mode, the remote user downloads a Java applet that acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The proxy provides the port forwarding services.

**Navigation Path**

Select **Thin Client** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

| Element                                         | Description                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Thin Client                              | Whether to allow thin client access to the SSL VPN.                                                                                                                                                                                                                                                                     |
| Port Forward List                               | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. |
| Download Port Forwarding Applet on Client Login | Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.                                                                                               |

## User Group Dialog Box—SSL VPN Full Tunnel Settings

Use the SSL VPN Full Tunnel settings to enable the full tunnel client access mode in your SSL VPN. When you enable full tunnel access, you should also define DNS/WINS server settings, browser proxy settings, and split tunneling for the user group.

In full tunnel client access mode, the tunnel connection is determined by the group policy configuration. The full tunnel client software, SSL VPN Client (SVC), must be downloaded to the remote client so that a tunnel connection can be established when the remote user logs in to the SSL VPN gateway.

**Tip**

For full tunnel client access to work, you must install the client software on the gateway. The user downloads the client when connecting to the gateway.

**Navigation Path**

Select **Full Tunnel > Settings** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use Other Access Modes if SSL VPN Client Download Fails | Whether to allow users to connect to the SSL VPN even if a problem prevents the client from downloading, installing, and starting correctly on the user's system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Full Tunnel Only                                        | If you select <b>Full Tunnel Only</b> , a user cannot connect to the SSL VPN if the download fails, which locks the user out of the network. Select <b>Use Other Access Modes</b> to allow clientless or thin client access if there is a download problem.                                                                                                                                                                                                                                                                                                                                                                                               |
| Client IP Address Pool                                  | The IP address ranges of the address pool that full tunnel clients will draw from when they log on. The address pool must be in the same subnet as one of the device's interface IP addresses.<br><br>Enter the address range separating the first and last IP address with a hyphen, for example, <b>10.100.10.2-10.100.10.255</b> . If you enter a single address, the pool has just one address. Do not enter subnet designations.<br><br>You can also enter the name of a network/host policy object that defines the range, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple ranges with commas. |
| Filter ACL                                              | The name of an extended access control list (ACL) object that restricts access to the SSL VPN. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Keep SSL VPN Client on Client Computer                  | Whether to leave the full client installed on the user's workstation after the user disconnects. If you do not allow the client to remain on the user's system, the client must be downloaded each time the user establishes a connection to the SSL VPN gateway.                                                                                                                                                                                                                                                                                                                                                                                         |
| Home Page URL                                           | The web address of the login home page for the full client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Client Dead Peer Detection Timeout                      | The time interval that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the remote user. Enter a value in the range 1-3600 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Gateway Dead Peer Detection Timeout                     | The time interval that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the gateway. Enter a value in the range 1-3600 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Key Renegotiation Method                                | The method by which the tunnel key is refreshed for the remote user group client: <ul style="list-style-type: none"> <li>• <b>Disabled</b>—Disables the tunnel key refresh.</li> <li>• <b>Create New Tunnel</b>—Initiates a new tunnel connection. Enter the time interval (in seconds) between the tunnel refresh cycles in the <b>Interval</b> field.</li> </ul>                                                                                                                                                                                                                                                                                        |

## User Group Dialog Box—SSL VPN Split Tunneling

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet for SSL VPNs.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

**Tip**

For optimum security, we recommend that you not enable split tunneling.

### Navigation Path

Select **Full Tunnel** > **Split Tunneling** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

### Field Reference

**Table 33-54** *User Group Dialog Box—Split Tunneling Settings*

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Option      | <p>Whether to allow split tunneling and if so, which traffic should be secured or transmitted unencrypted across the public network:</p> <ul style="list-style-type: none"> <li>• <b>Disabled—(Default)</b> No traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks.</li> <li>• <b>Tunnel Specified Traffic</b>—Tunnel all traffic from or to the addresses listed in the <b>Destinations</b> field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider.</li> <li>• <b>Exclude Specified Traffic</b>—Traffic goes in the clear from and to the addresses listed in the <b>Destinations</b> field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.</li> </ul> |
| Destinations       | <p>The IP addresses for hosts or networks that identify the networks that require traffic to travel across the tunnel and those that do not require tunneling. Whether traffic to these addresses is encrypted and tunneled to the gateway, or sent in the clear, is determined by your selection for <b>Tunnel Option</b>.</p> <p>Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple addresses with commas.</p>                                                                                                                                                                                                                                                                                                                                                    |
| Exclude Local LANs | <p>Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the <b>Exclude Specified Traffic</b> tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN.</p> <p>When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 33-54** *User Group Dialog Box—Split Tunneling Settings (Continued)*

| Element         | Description                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split DNS Names | <p>A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server.</p> <p>Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.</p> |

## User Group Dialog Box—Browser Proxy Settings

Use the Browser Proxy settings to configure proxy bypass for full tunnel access in an SSL VPN.

A security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers, which act as intermediaries between users and the Internet. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

### Tip

The browser proxy settings work only for Microsoft Internet Explorer; they do not work for other types of browsers.

|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxy Server                                         | The address of the proxy server: <ul style="list-style-type: none"> <li>IP address—The IP address or the name of a network/host object that specifies the address. Click <b>Select</b> to select the object from a list.</li> <li>Name—The fully qualified domain name, for example, proxy.example.com.</li> </ul> |
| Proxy Server Port                                    | The port number on the server that is used for proxy traffic, for example, 80. Enter a value in the range 1-65535.                                                                                                                                                                                                 |
| Do Not Use Proxy Server for Addresses Beginning With | If you configured a proxy, you can identify specific hosts for which the proxy should be bypassed. If the user opens these hosts in the browser, the proxy is not used in the connection.<br><br>Enter full IP addresses or fully qualified domain names. For example, 10.100.10.14 or www.cisco.com.              |

## User Group Dialog Box—SSL VPN Connection Settings

Use this SSL VPN Connection Settings page to configure the SSL VPN session connection settings for the user group, including the banner text. An SSL VPN session is disconnected if the client is connected longer than the session timeout or if it is idle longer than the idle timeout.

### Navigation Path

Select **Connection Settings** from the table of contents in the [Add or Edit User Group Dialog Box, page 33-58](#).

### Field Reference

**Table 33-56** *User Group Dialog Box—Connection Settings*

| Element         | Description                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Idle Timeout    | The idle timeout period for the SSL VPN session. The session is disconnected if the client is idle longer than the specified idle timeout. Values range from 0-3600 seconds.                                                                                             |
| Session Timeout | The timeout period for the SSL VPN session. The session is disconnected when this timeout is reached even if the user is still active. Values range from 1-1209600 seconds.                                                                                              |
| Banner Text     | The banner, for example, a welcome message, that is displayed to remote users when they connect to the SSL VPN.<br><br>You cannot use double quotes or new lines (carriage returns) in the banner text. However, you can include HTML tags to create the desired layout. |

## Add or Edit WINS Server List Dialog Box

Use the WINS Server Lists dialog box to create, copy, and edit WINS server list objects. A WINS Server List object defines a list of Windows Internet Naming Server (WINS) servers, which are used to translate Windows file server names to IP addresses.

### Navigation Path

Select **Manage > Policy Objects**, then select **WINS Server Lists** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                               |
| Description                     | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                               |
| WINS Server List                | The WINS servers that are defined for the object. <ul style="list-style-type: none"> <li>• To add a server, click the Add button and fill in the Add WINS Server dialog box (see <a href="#">Add or Edit WINS Server Dialog Box, page 33-74</a>).</li> <li>• To edit a server, select it and click the Edit button.</li> <li>• To delete a server, select it and click the Delete button.</li> </ul> |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                            |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .                                                                                                                               |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                         |

## Add or Edit WINS Server Dialog Box

Use the Add/Edit WINS Server dialog box to create a new WINS server entry or edit an existing entry in the table in the WINS Server Lists dialog box.

**Navigation Path**

From the [Add or Edit WINS Server List Dialog Box](#), click the **Add** button beneath the WINS Server List table, or select a server in the table and click the **Edit** button.

**Related Topics**

- [Configuring WINS/NetBIOS Name Service \(NBNS\) Servers To Enable File System Access in SSL VPNs, page 30-76](#)

**Field Reference****Table 33-58 Add/Edit WINS Server Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server                | The IP address of the WINS server used to translate Windows file server names to IP addresses. You can also enter the name of a network/host policy object that identifies the server. Click <b>Select</b> to choose a network/hosts object or to create a new object.                       |
| Set as Master Browser | Whether to server is a master browser. The master browser maintains the list of computers and shared resources.                                                                                                                                                                              |
| Timeout               | The period of time the security appliance waits for a response to a WINS query before sending the query again to the same server (if it is the only one), or to the next server (if there is more than one).<br><br>The default timeout is 2 seconds. The range is between 1 and 30 seconds. |
| Retries               | The number of times to retry sending WINS queries to the configured servers. The security appliance recycles through the list of servers this number of times before sending an error message.<br><br>The default is 2. The range is between 0 and 10.                                       |

# CHAPTER 34

## Using Map View

---

The following topics describe how to use the Map view:

- [Understanding Maps and Map View, page 34-1](#)
- [Working With Maps, page 34-8](#)
- [Displaying Your Network on the Map, page 34-14](#)
- [Managing VPNs in Map View, page 34-20](#)
- [Managing Device Policies in Map View, page 34-22](#)

## Understanding Maps and Map View

The Security Manager Map view provides a graphical view of your VPN and Layer 3 network topology.

Using the map view, you can investigate details of your VPN configuration graphically. Topological display of tunnels enables you to easily derive the relationship among multiple VPN configurations (for example, a hierarchical VPN). You can group devices to achieve a more complete picture of your VPN configuration. This is useful in situations where a hub failover pair is a peer with hundreds of spokes.

You can represent your Layer 3 network topology graphically, populating it with managed devices (called device nodes). You can make the picture of the topology more complete by adding unmanaged objects (called map objects) such as devices, clouds, and networks. For large networks, you can choose to simplify the topology graph by incorporating only a portion of the overall topology. You can save the topology maps for future use.

You can save multiple topology maps to reflect your network's geographical or functional organization. You can link a saved map to a node on a parent map, so that from the parent map you can drill down to the linked map with more detailed information (for more information, see [Using Linked Maps, page 34-13](#)). Saved maps are shared among all users who have the necessary access privileges.

You can launch other Security Manager features from the map view. In some cases, you can simplify the use of features by selecting nodes from the map before you start another feature. For example, you can select multiple nodes, then create a VPN that includes those nodes as members.

**Tip**

---

The network data that is displayed on maps is typically updated as this data changes. However, to be certain that a map displays current network data, you can refresh it manually by selecting **Map > Refresh Map**.

---

This section contains the following topics:

- [Understanding the Map View Main Page, page 34-2](#)
- [Map Toolbar, page 34-4](#)
- [Using the Navigation Window, page 34-4](#)
- [Maps Context Menus, page 34-5](#)

## Understanding the Map View Main Page

Map view enables you to create customized, visual topology maps of your network, within which you can view connections between your devices and easily configure VPNs and access control settings. The following figure identifies the functional areas of the Map view.

To open the Map view main page, click the **Map View** button in the toolbar.

You can undock the map window, which enables you to use other product features while keeping the map open. To undock the map, select **Map > Undock Map View**. To dock the map window, select **Map > Dock Map View**.

Figure 34-1 Map View Main Page

|   |                                                                             |   |                                                                                     |

## Map Toolbar

The following table describes the buttons on the map toolbar.

**Table 34-1** Map Toolbar

| Toolbar Button                                                                      | Description                                                                                                                                    |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Selects objects on the map. Click the button, then click items on the map.                                                                     |
|    | Pans the map. Click the button, click and hold on the map, then drag the cursor.                                                               |
|    | Zooms in on the map.                                                                                                                           |
|    | Zooms out from the map.                                                                                                                        |
|    | Zooms the map to fill a rectangle that you draw.                                                                                               |
|    | Zooms the map to include the entire map.                                                                                                       |
|    | Zooms the map to actual size.                                                                                                                  |
|   | Creates a new Security Manager-managed node. After you create the new device in the inventory, it is added to the active map as a device node. |
|  | Adds a new map object to the map.                                                                                                              |
|  | Adds a new link to the map.                                                                                                                    |
|  | Creates a new VPN connection between nodes on the map.                                                                                         |
|  | Select devices to show on the map as device nodes.                                                                                             |
|  | Select VPNs to show on the map.                                                                                                                |

## Using the Navigation Window

The navigation window displays a smaller version of the entire active map. The shaded rectangle defines the area of the map that is currently displayed.

Use the navigation window to select the portion of the map to view and to change the map zoom level.

- To toggle the display of the navigation window, select **Map > Show/Hide Navigation Window**.
- To pan the navigation control to select which portion of the map to display, click within the shaded rectangle and drag it to a new location.
- To change the zoom level, click one of the resizing handles in the corners of the shaded rectangle, then drag it to increase or decrease the area of the map to display. The map zooms to display the area covered by the map indicator.

The title bar in the navigation window displays the name of the map. If the map has unsaved changes, an asterisk (\*) appears next to the map name.

For information on other ways to pan and zoom maps, see [Panning, Centering, and Zooming Maps](#), page 34-11.

## Maps Context Menus

The following topics describe the menus that contain maps commands. To open the context menus, right-click map elements.

- [Managed Device Node Context Menu](#), page 34-5
- [Multiple Selected Nodes Context Menu](#), page 34-6
- [VPN Connection Context Menu](#), page 34-6
- [Layer 3 Link Context Menu](#), page 34-7
- [Map Object Context Menu](#), page 34-7
- [Map Background Context Menu](#), page 34-7

### Managed Device Node Context Menu

The Managed Device Node context menu opens when you right-click a map node that represents a managed device. The commands that you see depend on the type of device you select. The following table lists all commands that you might see.

**Table 34-2** *Managed Device Node Context Menu*

| Menu Command                  | Description                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit Firewall Policies        | Edits firewall policies on the device.<br>Select a firewall policy type from the submenu to edit it.                                                                                                          |
| Edit Firewall Settings        | Edits firewall settings on the device.<br>Select a setting from the submenu to edit it.                                                                                                                       |
| Edit VPN Peers                | Edits peers in VPNs in which the device participates.                                                                                                                                                         |
| Edit VPN Policies             | Edits VPN policies on the device.                                                                                                                                                                             |
| Device Properties             | Displays device properties.                                                                                                                                                                                   |
| Clone Device                  | Creates a copy of the device. See <a href="#">Cloning a Device</a> , page 3-54.                                                                                                                               |
| Copy Policies Between Devices | Copies policies between the device and other devices. See <a href="#">Copying Policies Between Devices</a> , page 5-31.                                                                                       |
| Share Device Policies         | Shares device local policies.                                                                                                                                                                                 |
| Catalyst Summary Info         | Allows you to view high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered. See <a href="#">Viewing Catalyst Summary Information</a> , page 65-2. |
| Show in Device View           | Opens the Device View for the selected device.                                                                                                                                                                |
| Device Manager                | Launches the Device Manager. See <a href="#">Starting Device Managers</a> , page 69-4.                                                                                                                        |

**Table 34-2** *Managed Device Node Context Menu (Continued)*

| Menu Command                | Description                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|
| Inventory Status            | Displays the Inventory Status window for the device. See <a href="#">Inventory Status Window, page 69-2</a> . |
| Show VPN Peers              | Shows peers in VPNs in which the device participates.                                                         |
| Preview Configuration       | Previews the device configuration with all committed changes included.                                        |
| Show Containment            | Shows the security contexts and service modules in devices that have them.                                    |
| Node Properties             | Displays node properties.                                                                                     |
| Set Linked Map              | Creates a link from this node to another map.                                                                 |
| Open Linked Map             | Opens the map that is linked to the node.                                                                     |
| Discover Policies on Device | Discovers policies on the device.                                                                             |
| Move To Center              | Pans the map to display the node in the center.                                                               |
| Delete Device               | Deletes the device from the device inventory.                                                                 |
| Remove from Map             | Removes the node from the map.                                                                                |

## Multiple Selected Nodes Context Menu

The Multiple Selected Device Node context menu opens when you select more than one map node, then right-click on a selected node.

If all of the selected nodes are not VPN-capable, the commands to configure VPNs do not appear.

**Table 34-3** *Multiple Selected Nodes Context Menu*

| Menu Command              | Description                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Create Point to Point VPN | Creates a point to point VPN between two selected devices.<br>All selected nodes must be managed and VPN-capable.                                                       |
| Create Hub and Spoke VPN  | Creates a hub and spoke VPN that includes the selected nodes.<br>The node that you right-click becomes the VPN hub. All selected nodes must be managed and VPN-capable. |
| Create Meshed VPN         | Creates a full mesh VPN that includes the selected nodes.<br>All selected nodes must be managed and VPN-capable.                                                        |
| Remove Selected Nodes     | Removes all selected device nodes. Appears only if you right-click on a selected device node.                                                                           |
| Delete Map Objects        | Deletes all selected map objects. Appears only if you right-click on a selected map object.                                                                             |

## VPN Connection Context Menu

The VPN Connection context menu opens when you right-click on a VPN connection on the map. For more information, see [Editing VPN Policies or Peers From the Map, page 34-22](#).

**Table 34-4 VPN Connection Context Menu**

| Menu Command      | Description                 |
|-------------------|-----------------------------|
| Edit VPN Peers    | Edits the peers in the VPN. |
| Edit VPN Policies | Edits the VPN policies.     |

## Layer 3 Link Context Menu

The Layer 3 Link context menu opens when you right-click on a layer 3 link on the map.

**Table 34-5 Layer 3 Link Context Menu**

| Menu Command    | Description                    |
|-----------------|--------------------------------|
| Link Properties | Displays the link properties.  |
| Delete Link     | Deletes the link from the map. |

## Map Object Context Menu

The Map Object context menu opens when you right-click a map object that does not represent a managed device.

**Table 34-6 Map Object Context Menu**

| Menu Command      | Description                                     |
|-------------------|-------------------------------------------------|
| Node Properties   | Displays the node properties.                   |
| Move To Center    | Pans the map to display the node in the center. |
| Set Linked Map    | Links the node to a map.                        |
| Open Linked Map   | Opens the map to which the node is linked.      |
| Delete Map Object | Deletes the map object.                         |

## Map Background Context Menu

The Map Background context menu opens when you right-click in the background area of a map, that is, not on any object or link.

**Table 34-7 Map Background Context Menu**

| Menu Command        | Description                                                           |
|---------------------|-----------------------------------------------------------------------|
| Show Devices on Map | Selects the managed devices to show on the map.                       |
| Show VPNs on Map    | Selects the VPNs to display on the map.                               |
| Add Map Object      | Adds a map object to the map.                                         |
| Add Link            | Adds a Layer 3 link to the map.                                       |
| New Device          | Creates a new managed device and adds it to the map as a device node. |
| New VPN             | Creates a new VPN and adds it to the map.                             |
| Find Map Node       | Finds nodes on the map.                                               |

**Table 34-7** Map Background Context Menu (Continued)

| Menu Command                | Description                                              |
|-----------------------------|----------------------------------------------------------|
| Open Map                    | Opens a saved map.                                       |
| Save Map                    | Saves the open map.                                      |
| Show/Hide Navigation Window | Toggles the display of the navigation window on the map. |
| Map Properties              | Displays the properties of the map.                      |
| Hierarchical layout         | Arranges the network nodes in a hierarchical layout.     |
| Radial layout               | Arranges the network nodes in a radial layout.           |
| Circular layout             | Arranges the network nodes in a circular layout.         |
| Dock/Undock Map             | Undocks the Map view.                                    |

## Access Permissions for Maps

Access to maps is controlled based on two systems of user privileges:

- Device privileges—You must have at least read privileges to all the devices in a map to open the map.
- Map privileges—Access to maps is based on your Security Manager user role. There are two levels of map access:
  - Read-only—You can open maps, but you cannot modify them. If you have this map privilege level, the features for modifying maps are not available.
  - Read-write—You can modify maps. All map modification features are available.

## Working With Maps

A map is a representation of a portion of your network. You can create and save multiple maps to address your network management needs. To work with any map, you must be in Map view (select **View > Map View**).

After you create and save a map, the map is available to all users on the system that have at least read privileges to all the devices on the map. Users that do not have read privileges to a device on a map do not see the map in the list of existing maps when they try to open a map. For more information, see [Access Permissions for Maps, page 34-8](#).

You can only have one map open at a time. If a map is open and you create a new map or open an existing map, you are prompted to save or discard any unsaved changes that you made to the current map.

Multiple users can open and modify a map at the same time. When a user saves changes to a map, any other users who are using the map are notified and have the option to do one of the following:

- Update their map to the version saved by the other user, losing any changes they have made.
- Save their version of the map as a new map, preserving any changes they made.

This section contains the following topics:

- [Creating New or Default Maps, page 34-9](#)
- [Opening Maps, page 34-10](#)

- [Saving Maps](#), page 34-10
- [Deleting Maps](#), page 34-10
- [Exporting Maps](#), page 34-11
- [Arranging Map Elements](#), page 34-11
- [Panning, Centering, and Zooming Maps](#), page 34-11
- [Selecting Map Elements](#), page 34-12
- [Searching for Map Nodes](#), page 34-12
- [Using Linked Maps](#), page 34-13
- [Setting the Map Background Properties](#), page 34-13

## Creating New or Default Maps

You have two options for creating a new map:

- Create an empty map—To create a new empty map, select **Map > New Map**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it. For information about adding elements to a map, see [Displaying Your Network on the Map](#), page 34-14.
- Create a new map containing all managed devices and VPNs in the inventory—This is called the default map. Generating the default map is a good way to create a map. After generating the map, save it with a unique name to make it a standard map and modify it as desired.

You can generate the default map whenever you want to, and it contains the inventory as it exists at the time you generate it. You cannot specifically save the default map *as* the default map; it is regenerated every time you select it.

The following procedure explains how to create a new map using the default map.

### Tips

- If you refresh the map (select **Map > Refresh Map**), items that you added to the inventory after generating the default map are not added to the map. You must reopen the default map to see new devices.

---

**Step 1** In Map view, select **Map > Open Map**.

**Step 2** Select **Default Map** from the Available Maps list, then click **OK**.

**Note** If you do not have sufficient access rights to all devices in the inventory, the default map that opens shows only the subset of devices for which you do have access rights. For more information, see [Access Permissions for Maps](#), page 34-8.

---

**Step 3** To save the default map as a standard map, select **Map > Save Map** or **Map > Save Map As**, enter a name for the map and click **OK**.

---

## Opening Maps

To open an existing map, select **Map > Open Map**, select the desired map from the list of available maps, and click **OK**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it.

The list of available maps includes a special map called the **Default Map**. This map contains all of the managed devices and VPNs in the inventory. You are essentially creating a new map each time you open it. For more information about the default map, see [Creating New or Default Maps, page 34-9](#).

**Tip**

You can open any map that you have created or the default map. You can also open any map that another user has created provided you have the requisite permission settings with regard to the devices shown on that map (see [Access Permissions for Maps, page 34-8](#)).

- [Understanding Map Elements, page 34-14](#)

## Saving Maps

To save the active map, select **Map > Save Map**. Any changes that you made since you last saved it are saved. If you did not save the map previously, the Save Map As dialog box opens, enabling you to assign a name to the map and save it.

To save a map under a new name, select **Map > Save Map As**. The map name can be as long as 256 characters, but cannot be the reserved names “Default Map” or “New Map.”

If you close a map that contains unsaved changes, you are prompted to save the changes.

If your Security Manager session closes automatically because of inactivity when a map is open with unsaved changes, the current version of the map is saved if it has a name. If you have not yet saved the map, the map is discarded. For example, if you generate the default map, or create a new map, and do not save it before your session times out, you cannot retrieve that map.

## Deleting Maps

If you no longer need a map, you can delete it (presuming that you have edit permission). Deleting a map does not delete any devices or VPNs shown on the map, nor does it delete or modify their configurations; only the map is deleted.

When you delete a map, it is permanently deleted from the server. Other users cannot use the deleted map.

To delete a map, select **Map > Delete Map**, select the map you want to delete from the available maps list and click **OK**. You are asked to confirm the deletion.

You must already be in Map view (select **View > Map View**) to delete a map.

## Exporting Maps

When viewing a map, you can export the map to a scalable vector graphics (SVG) image file for use outside of Security Manager.

### Related Topics

- [Working With Maps, page 34-8](#)
- [Understanding Map Elements, page 34-14](#)

- 
- Step 1** Select **Map > Export Map**. The Export Topology Map to SVG dialog box opens.
- Step 2** Browse to the location in which to save the file.
- Step 3** Enter a filename in the File name field. The correct file extension will be added for you.
- Step 4** Click **Save**.
- 

## Arranging Map Elements

To move a map element, click and hold, then drag it to the desired position. Attached links move automatically, but the other end of the link remains where it is.

You can also automatically arrange the network nodes on the map in several predefined layouts. Only nodes that are already displayed on the map are arranged. Any nodes that you later add do not follow the layout.

To select a map layout, right-click the map background, then select one of the following layouts from the map context menu:

- Hierarchical Layout—Arranges the nodes in a hierarchical layout.
- Radial Layout—Arranges the nodes in a radial layout.
- Circular Layout—Arranges the nodes in a circular layout.

## Panning, Centering, and Zooming Maps

There are many options for navigating maps. You can pan the map (move around in the map without changing the zoom level), pan a map so that a particular map element is centered in your view, or zoom in or out to see a different map extent.

### To pan a map without changing the zoom level:

- Click the Pan Map toolbar button, then click and hold anywhere on the map and drag the cursor.
- Use the vertical and horizontal scroll bars that are available if the entire map does not fit in the visible page.
- Click and drag the shaded rectangle in the navigation window.
- To center the display of the map on a particular map element, right-click the element, then select **Move to Center**.

**To zoom in or out of a map:**

- To change the zoom level of the map in predefined increments:
  - To zoom in on the map, select **Map > Zoom In**, or click the **Zoom In** toolbar button.
  - To zoom out from the map, select **Map > Zoom Out**, or click the **Zoom Out** toolbar button.
- To zoom into a specific area of the map, click **Zoom Rectangle** in the map toolbar, then click the map and drag a rectangle around the area. When you release the mouse button, the map zooms to display the area defined by the rectangle.
- Alternatively, to zoom in to or out of a specific area of the map, click and drag the corner of the shaded rectangle in the navigation window.
- To display the entire map, select **Map > Fit to Window**.
- To display the map at actual size, select **Map > Display Actual Size**.

- [Using the Navigation Window, page 34-4](#)

## Selecting Map Elements

The following table describes how to select map elements. If the selected element contains other elements (for example, a Catalyst switch that contains an FWSM), the containment relationship is shown. For more information, see [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances, page 34-16](#).

**Table 34-8**      *Selecting Network Elements*

| To select...                        | Do the following                                               |
|-------------------------------------|----------------------------------------------------------------|
| A single map element                | Click the element.                                             |
| Multiple noncontiguous map elements | Ctrl+click each element.                                       |
| Multiple contiguous map elements    | Click the map and drag a rectangle that includes the elements. |

## Searching for Map Nodes

To search for a map node to help you find it in the active map, select **Map > Find Map Node**. This command opens the Find Node dialog box.

The Find Node dialog box initially lists all objects on the map. Use the fields above the list to filter it (the list shows only objects that satisfy all filter criteria). When you find the desired node, select it in the list and click **OK** to have the node centered and selected in the map.

To filter the list, you can:

- Select a node type from the **Type** list to show only objects of that type.
- Enter the name, or at least the initial characters of the name, in the **Name** field. The list is filtered as you type. Your search term must be from the start of the object name. You cannot use wildcard characters.
- Enter all or part of the IP address or subnet mask. The list is filtered as you enter information.

## Using Linked Maps

A linked map is a map that you associate with a map element on another map. Because it is not practical to include all the nodes on a large network in a single map, you can use linked maps to create a hierarchical topology of your network.

You cannot link a node to the another node in the same map.

### Before You Begin

You must create the map to link to before you can link to it.

- 
- Step 1** Right-click the map element to which to link a map, then select **Set Linked Map**. The Set Linked Map dialog box opens.
- Step 2** Select a map to associate with the selected map element, then click **OK**.
- Step 3** To open the linked map, right-click the linked node, then select **Open Linked Map**. The current map closes and the linked map opens.
- 

## Setting the Map Background Properties

You can change the background of a map by changing the color or by configuring an image. A suggested use for a background image is to use an image that represents a geographic area. Then you can position map elements according to their geographic locations.

Some background images are included with Security Manager. You can also transfer images to the server to use as background images. You can use background images of the following file formats: JPEG, GIF, PNG, IVL, and SVG. If you want to use a new image, copy the image file to the Security Manager server file system by connecting directly to the server. For security reasons, Security Manager does not provide a method of transferring files to the server.

To configure the map background, in Map view, select **Map > Map Properties** to open the Map Settings dialog box.

- To configure a background image, select it in the file list. (Select **none** to remove the map's background image.)

If the image is not listed, click **Add** and browse to the file you placed on the server using the Import Background Image dialog box. Click **OK** to have Security Manager add it to the list of available background images.

If you no longer need a listed image, select it and click **Delete**.

### Tip

---

You can control the position and scale of the image using the X and Y coordinates and scale settings. The X,Y source point is the upper left corner of the image. You can use positive or negative numbers. You must experiment to get the results you desire. The scale setting is in percentage.

---

- To change the background color, click **Select** next to the background color field and choose the desired color.

# Displaying Your Network on the Map

You use the map view to represent your network topology by creating maps. A map is a visual representation of your network, or a portion of it if it is too large to fit on a single map. Maps consist of map elements that represent devices, links, and other objects in your network. For more information about map, see [Working With Maps, page 34-8](#).

The following topics describe how to create maps:

- [Understanding Map Elements, page 34-14](#)
- [Displaying Managed Devices on the Map, page 34-16](#)
- [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances, page 34-16](#)
- [Using Map Objects To Represent Network Topology, page 34-17](#)
- [Creating and Managing Layer 3 Links on the Map, page 34-19](#)

## Understanding Map Elements

All objects that can appear on a map are map elements. You display map elements on a map to create a representation of a portion of your network. For more information about maps, see [Working With Maps, page 34-8](#). To open a map, see [Opening Maps, page 34-10](#).

The following tables describe the elements that can appear on a map:

- [Table 34-9 on page 34-14](#) describes the device nodes that can appear on a map. These elements are managed by Security Manager.
- [Table 34-10 on page 34-15](#) describes the map objects that can appear on a map. These elements are not managed by Security Manager.
- [Table 34-11 on page 34-15](#) describes the map element indicators that can appear with a device node.

**Table 34-9**      *Device Node Types*

| Node Type                                    | Icon                                                                                | Description                                                                                                                            |
|----------------------------------------------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Firewall                                     |  | When you select a device, its security contexts are highlighted.                                                                       |
| Firewall security context                    |  | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| Adaptive Security Appliance                  |  | When you select a device, its security contexts are highlighted.                                                                       |
| Adaptive Security Appliance security context |  | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| Router                                       |  | Router or VPN concentrator.                                                                                                            |

**Table 34-9** Device Node Types (Continued)

| Node Type                             | Icon                                                                              | Description                                                                                                                            |
|---------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Catalyst 6500/7600 or Catalyst switch |  | When you select a Catalyst device node, any Firewall Service Modules contained in it are highlighted.                                  |
| Firewall Services Module (FWSM)       |  | When you select a Firewall Services Module, the security contexts it contains are highlighted on the map.                              |
| FWSM security context                 |  | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| IPS Sensor or Security Service Module |  | An IPS sensor.                                                                                                                         |
| VPN connection                        |  | Any type of VPN connection.<br>For GET VPNs, a dashed line indicates the connection between group members and key servers.             |

**Table 34-10** Map Object Types

| Node Type          | Icon                                                                                | Description                                                                             |
|--------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Unmanaged firewall |  | Unmanaged firewall device.                                                              |
| Unmanaged router   |  | Unmanaged router.                                                                       |
| Network            |  | Network with a specified address space.                                                 |
| Host               |  | Network host.<br>Examples: CSA, Syslog Server, CA Server, AAA Host                      |
| Cloud              |  | An unspecified group of map objects that provides connectivity between specified nodes. |
| Layer 3 link       | —                                                                                   | Layer 3 network connection                                                              |

**Table 34-11** Map Element Indicators

| Indicator  | Icon                                                                                | Description                    |
|------------|-------------------------------------------------------------------------------------|--------------------------------|
| Linked map |  | Node is linked to another map. |

**Related Topics**

- [Using Map Objects To Represent Network Topology, page 34-17](#)
- [Creating and Managing Layer 3 Links on the Map, page 34-19](#)

## Displaying Managed Devices on the Map

A device node represents a device that is managed by Security Manager. You add a device node to a map by selecting the device from the Security Manager inventory.

When you add a device node to a map, its layer 3 connectivity to other nodes on the map is created automatically. For more information, see [Creating and Managing Layer 3 Links on the Map, page 34-19](#).

You can add, remove, or show managed nodes by the following means:

- **To add devices that are already in the Security Manager inventory**—Select **Map > Show Devices on Map** to open a device selector. Select the desired devices from the list of available devices and click >> to move them to the selected devices list. You can select device groups to move all devices in the group. Click **OK** when the list of selected devices has the desired nodes. Only those devices in the selected list are shown on the map.

You can remove devices by selecting them in the selected list and clicking <<.

- **To add a new device to the map and the device inventory**—Click the **New Device** button in the map toolbar or right-click the map background and select **New Device**. The New Device dialog box opens. Follow the procedures for adding new devices described in [Adding Devices to the Device Inventory, page 3-6](#).
- **To remove a managed node**—Right-click the node and select **Remove from Map**.
- **To locate a device on the open map when in Device view**—Right-click the device in the device selector and select **Show in Map view**. If the device is shown on the active map, it is shown centered and highlighted on the undocked map. You are told that the device cannot be found if the device is not shown on the active map.
- **To locate a device in Device view from the map**—Right-click the device and select **Show in Device View**. Device view is opened with the device selected so that you can edit its policies.

**Related Topics**

- [Understanding Map Elements, page 34-14](#)
- [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances, page 34-16](#)

## Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances

The containment relationship between Catalyst and Adaptive Security Appliance (ASA) devices and their service modules and security contexts, between PIX 7.x+ devices and FWSM and their security contexts, or between IPS devices and their virtual sensors, is displayed in maps as follows:

- When you select a Catalyst device, nodes that represent its Firewall Services Modules (FWSM) are highlighted.
- When you select an ASA, nodes that represent its Security Service Modules are highlighted.
- When you select a service module, the device that contains it is highlighted.

- When you select an IPS device, the nodes that represent virtual sensors defined on the device are highlighted.
- You can view a list of the security contexts contained in an ASA, firewall, or FWSM device, or the virtual sensors contained in an IPS device, by right-clicking the node and selecting **Show Containment**. This command also shows the service modules in a device that has them.
- When you select a security context node, all its ancestor device nodes are highlighted.
- When you select a virtual sensor, the device on which it is defined is highlighted.

## Using Map Objects To Represent Network Topology

You can add map elements to a map that represent objects (such as devices and links) that Security Manager does not manage. These nodes are called map objects. You can use map objects to create a more useful representation of your network topology. (If you want to add a managed device, see [Displaying Managed Devices on the Map, page 34-16](#).)

You can add layer 3 links between any map elements, whether they are device nodes, map nodes, or a combination of both types.

**Tip**

To delete a map object, right-click the object and select **Delete Map Object**.

- 
- Step 1** Select **Map > Add Map Object**. The Add Map Object dialog box appears (see [Add Map Object and Node Properties Dialog Boxes, page 34-18](#)).
- Step 2** Do one of the following:
- If you are adding a map object based on the definition of an Security Manager policy object, click **Copy Policy Object** to open the [Select Policy Object Dialog Box, page 34-18](#). Then, select the type of object (AAA server, network/host, PKI enrollment), click **Select** to choose the object, then click **OK** in the Select Policy Object dialog box. Information from the policy object is entered in the Add Map Object dialog box.  
The name of the object is used as the map object name, but you can edit this if desired.
  - If you are adding a map object that is not based on a policy object, enter a name for the map object in the **Name** field.
- Step 3** Select the type of object that the node represents from the **Type** list. If you selected a policy object, the type is pre-selected, but you can change the selection.
- Step 4** (Optional) Add interfaces to the node by doing the following for each interface:
- a. Click **Add** to open the [Interface Properties Dialog Box, page 34-19](#). If items already appear in the list, you can select them and click **Edit** to change them.
  - b. Enter an interface name, IP address, and network mask, then click **OK**.
- Step 5** Click **OK**. The map object is added to the center of the map. Move it to the desired location.
-

## Add Map Object and Node Properties Dialog Boxes

For unmanaged map objects, the Add Map Object and Node Properties dialog boxes are the same. Use the Add Map Object dialog box to add an object to the map. Use the Node Properties dialog box to view or edit map object properties. For more information, see [Using Map Objects To Represent Network Topology, page 34-17](#).

For managed map objects (such as a managed device), the Node Properties dialog box is read-only. It displays the object name, type, and list of interface names and IP addresses (if any are defined in Security Manager for the device). The reference information below does not apply to this version of the Node Properties dialog box.

### Navigation Path

- To open the Add Map Object dialog box, select **Map > Add Map Object**.
- To open the Node Properties dialog box, right-click a map object or managed device and select **Node Properties**.

### Field Reference

**Table 34-12** Add Map Object and Node Properties Dialog Boxes for Unmanaged Nodes

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                      | The name of the map object. If you select a policy object, the name of the object is automatically used, but you can change it.                                                                                                                                                                                                                                                                                                                                                      |
| Copy Policy Object button | Click to browse for a policy object to use as the basis for the map object using the <a href="#">Select Policy Object Dialog Box, page 34-18</a> .                                                                                                                                                                                                                                                                                                                                   |
| Type list                 | The type of object you are creating. If you select a policy object, a type is selected for you, but you can change it if necessary.                                                                                                                                                                                                                                                                                                                                                  |
| Interfaces table          | The interfaces on the node. If you select a policy object, information might have been added to this table. <ul style="list-style-type: none"> <li>• To add an interface, click the <b>Add (+)</b> button and fill in the <a href="#">Interface Properties Dialog Box, page 34-19</a>.</li> <li>• To edit an interface, select it and click the <b>Edit (pencil)</b> button.</li> <li>• To delete an interface, select it and click the <b>Delete (trash can)</b> button.</li> </ul> |

## Select Policy Object Dialog Box

Use the Select Policy Object dialog box to add an object to the map that is defined in a policy object.

Select the type of object that defines the node you want to add to the map from the **Select a Policy Object** list, then click **Select** to select the specific policy object. If you know the object's name, you can type it into the text box instead of clicking Select.

For more information, see [Using Map Objects To Represent Network Topology, page 34-17](#).

### Navigation Path

To open this dialog box, click **Copy Policy Object** in the Add Map Object dialog box (see [Add Map Object and Node Properties Dialog Boxes, page 34-18](#)).

## Interface Properties Dialog Box

Use the Interface Properties dialog box to add and edit interfaces on map objects. For more information, see [Using Map Objects To Represent Network Topology, page 34-17](#).

### Navigation Path

To open this dialog box, click the **Add** or **Edit** button in the [Add Map Object and Node Properties Dialog Boxes, page 34-18](#).

### Field Reference

**Table 34-13** *Interface Properties Dialog Box*

| Element                | Description                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------|
| Interface Name         | The interface name.                                                                                  |
| Interface IP Addr/Mask | The interface IP address and network mask, for example, 10.100.10.0/24 or 10.100.10.0/255.255.255.0. |

## Creating and Managing Layer 3 Links on the Map

A layer 3 link is a line on the map that represents a network connection between two device interfaces.

Layer 3 connectivity information is automatically added to the map when you add map elements that have interface information. When you add a map element that has interface information, one of the following happens:

- If the interface is on a network that is not represented on the map as a network map object, a network map object is added to the map with a layer 3 link to the new map element.
- If the interface is on a network that is represented on the map as a network map object, a layer 3 link is added between the new map element and the network map object.

When you remove a node interface that is a layer 3 link endpoint, the link is also removed.

You can add additional layer 3 links between device nodes and map objects to illustrate your network's connectivity. Adding Layer 3 links to a map does not configure any network devices. Layer 3 links are just visual elements on the map.

You create layer 3 links to connect any two interfaces on a map. Depending on the interfaces that you choose, the layer 3 link might include intermediary networks or network clouds. In some cases, you have the option to select which intermediary networks and networks clouds are inserted between the connected interfaces.

The following procedure explains how to manually create a new layer 3 link.

### Tips

- The automatic addition of network objects and links is called Autolink. You can configure Autolink to not automatically add private or certain reserved network addresses. To configure these settings, select **Tools > Security Manager Administration**, then click **Autolink**.
- To view the properties of a link, right-click the layer 3 link and select **Link Properties**.
- To delete a layer 3 link, right-click the layer 3 link to be removed and select **Delete Link**. Deleting a layer 3 link does not delete any intermediary network or network clouds between map elements.

- 
- Step 1** In Map view, click **Map > Add Link** or the Add Link button in the toolbar.
- Step 2** Click one of the map elements to connect, then click the other map element to connect.
- Step 3** If the map elements contain interfaces, select the source and destination interfaces for the link in the [Select Interfaces and Link Properties Dialog Boxes](#), then click **OK**.  
The Add Link dialog box might open, depending on which interfaces you select.
- Step 4** If the [Add Link Dialog Box](#) opens, select which intermediary objects and network clouds to insert, then click **OK**.
- 

## Select Interfaces and Link Properties Dialog Boxes

The Select Interfaces and Link Properties dialog boxes are used with layer 3 links on maps. These dialog boxes show information about the source and destination devices for the link (the source being the first device you clicked when making the link).

If you are creating a link, the Select Interfaces dialog box is used. If there are interfaces defined for the device in Security Manager, select the desired source and destination interfaces for the link you are creating from the **Source/Destination Interface** list.

**Tip**

When creating a link, if there are no interfaces defined for either device, the Interface lists are greyed out. If one device has interfaces defined, both fields are active, but empty for the device that does not have interfaces defined for it. You cannot change the interface when viewing link properties.

---

### Navigation Path

For information on how to create layer 3 links or view their properties, see [Creating and Managing Layer 3 Links on the Map](#), page 34-19.

## Add Link Dialog Box

Use the Add Link dialog box to select how to represent the layer 3 link that you are adding to the map.

The contents of the Add Link dialog box vary according to which nodes and interfaces you are connecting. Select the check boxes for each intermediary map object (network or cloud) that you want to insert between the connected nodes. If desired, you can change the names of the map objects.

### Navigation Path

This dialog box might open when you add a link between nodes, depending on which interfaces you select to connect. For the procedure, see [Creating and Managing Layer 3 Links on the Map](#), page 34-19.

## Managing VPNs in Map View

The following topics describe how to manage VPNs in the Map view:

- [Displaying Existing VPNs on the Map](#), page 34-21
- [Creating VPN Topologies in Map View](#), page 34-21
- [Editing VPN Policies or Peers From the Map](#), page 34-22

## Displaying Existing VPNs on the Map

To display an existing VPN on the map, select **Map > Show VPNs on Map**. You are prompted with a list of existing VPNs. Select the ones you want from the available VPNs list and click >> to move them to the selected list.

You can also remove a VPN using this command. Select the VPNs you want to remove from the selected VPNs list and click <<. When you remove a VPN, only the VPN tunnels are removed. The device nodes remain on the map.

When you display a VPN, all of its member devices are added to the map as device nodes, and all of its tunnels are highlighted. However, devices that you removed from the map previously are not added, even if they are members of a VPN that you display. You can add such devices to the map manually, and their VPN connectivity is displayed.

A VPN tunnel is a line on the map that represents a VPN connection between two devices. VPN tunnels are not added to the map automatically when you add a device node that is a member of a VPN. However, if the VPN was already selected to be shown on the map, adding a device in the VPN to the map will also display the tunnel.

For an explanation of the icons used in the map, see [Understanding Map Elements, page 34-14](#).

## Creating VPN Topologies in Map View

You can create VPN connections between VPN-capable managed device nodes that are displayed on the map. You cannot create Extranet VPNs, however.

To create a VPN, do one of the following:

- Click the **New VPN** button in the toolbar and select the type of VPN you want to configure: point-to-point, hub and spoke, or full mesh.
- Select the devices that you want to participate in the VPN (use Ctrl+click to select multiple devices), and either right click and select the command for the desired type of VPN, or click the **New VPN** button and select the VPN type.

Consider the following tips:

- Select only 2 devices to create a point-to-point VPN.
- If you create a hub-and-spoke VPN, the device you right-click is initially defined as the hub, but you can change that in the wizard.
- While in the wizard, you can add or remove devices. You are not restricted to the devices you selected on the map.

Using either technique, the Create VPN wizard opens, where you can create the VPN. For more information, see [Creating or Editing VPN Topologies, page 24-28](#) or click the Help button in the wizard.

The VPN is displayed on the map when you are finished with the wizard.

### Related Topics

- [Selecting Map Elements, page 34-12](#)

## Editing VPN Policies or Peers From the Map

You can edit VPN policies, or the peers that participate in a VPN, from map view. To edit policies or peers, right-click a VPN tunnel or device node and select one of these commands:

- **Edit VPN Policies**—To open the Site-to-Site VPN Manager, where you can edit the policies that define the VPN. For more information, see [Site-to-Site VPN Manager Window, page 24-18](#).
- **Edit VPN Peers**—To open a dialog box that allows you to configure the peers that participate in the VPN. Click the **Help** button in the dialog box for more information.
- **Show VPN Peers**—To see which devices participate in a VPN without editing the list (VPN Peers dialog box).

If the device participates in more than one VPN, you are first prompted to select the desired VPN (with the Select VPN to Configure dialog box) before the appropriate dialog box is opened.

## Managing Device Policies in Map View

You can perform only basic policy management and configure firewall services policies in Map view. You cannot configure other types of policies. The following topics describe how to manage policies from the Map view:

- [Performing Basic Policy Management in Map View, page 34-22](#)
- [Managing Firewall Policies in Map View, page 34-23](#)
- [Managing Firewall Settings in Map View, page 34-23](#)

## Performing Basic Policy Management in Map View

You can perform some basic policy management tasks in Map view. Right click the device and select one of the following commands:

- **Copy Policies Between Devices**—To copy local device policies from one device to another. For more information on copying policies, see [Copying Policies Between Devices, page 5-31](#).
- **Share Device Policies**—To create shared policies from local device policies. For more information on sharing policies, see [Sharing Multiple Policies of a Selected Device, page 5-39](#).
- **Clone Device**—To create a copy of a device, including its policies. For more information on cloning devices, see [Cloning a Device, page 3-54](#).
- **Preview Configuration**—To view the configuration file that will be generated for the device, including the changes from the previous deployment. For more information on previewing configurations, see [Previewing Configurations, page 8-45](#).
- **Discover Policies on Device**—To discover the policies defined on the device and configure them in Security Manager, wiping out whatever policies are defined in Security Manager for the device. For more information device discovery, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

## Managing Firewall Policies in Map View

You can configure firewall policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

Tip

---

If you want to assign a shared policy to a device, see [Performing Basic Policy Management in Map View, page 34-22](#).

---

To configure local firewall policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Policies > AAA Rules**—To configure AAA policies, which control who is allowed access to the device and what services they are allowed to use once they have access. For more information on configuring AAA rules, see [AAA Rules Page, page 15-10](#).
- **Edit Firewall Policies > Access Rules**—To configure Access Rules policies, which control the traffic that flows through a device. For more information on configuring access rules, see [Access Rules Page, page 16-9](#).
- **Edit Firewall Policies > Inspection Rules**—To configure Inspection Rules policies, which analyze traffic at the application layer and track TCP and UDP sessions to perform refined access control. For more information on configuring inspection rules, see [Inspection Rules Page, page 17-7](#).
- **Edit Firewall Policies > Botnet Traffic Filter Rules**—(ASA 8.2 and higher only) To configure Botnet Traffic Filter Rules policies, which monitor web traffic. For more information on configuring botnet traffic filter rules, see [Botnet Traffic Filter Rules Page, page 19-9](#).
- **Edit Firewall Policies > Transparent Rules**—To configure Transparent Rules policies, which define EtherType rules for transparent firewalls. For more information on configuring inspection rules, see [Transparent Rules Page, page 22-3](#).
- **Edit Firewall Policies > Web Filter Rules**—To configure Web Filter Rules policies, which define rules for web access. For more information on configuring web filter rules, see [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#) or [Web Filter Rules Page \(IOS\), page 18-11](#).
- **Edit Firewall Policies > Zone Based Firewall Rules**—(IOS 12.4(6)T and higher only) To configure Zone Based Firewall Rules policies, which configure inspection and web filtering using security zones. For more information on configuring zone based firewall rules, see [Zone-based Firewall Rules Page, page 21-57](#).

### Related Topics

## Managing Firewall Settings in Map View

You can configure firewall settings policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

**Tip**

If you want to assign a shared policy to a device, see [Performing Basic Policy Management in Map View, page 34-22](#).

To configure local firewall settings policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Settings > AAA Firewall**—(ASA/PIX/FWSM only) To configure AAA Firewall settings policies, which configures proxy, authentication challenge, MAC exempt lists, and other general AAA settings. For more information on configuring AAA firewall settings, see [AAA Firewall Settings Page, Advanced Setting Tab, page 15-19](#) and [AAA Firewall Page, MAC-Exempt List Tab, page 15-23](#).
- **Edit Firewall Settings > Access Control**—To configure Access Control settings policies, which configures optimization and other general access control settings. For more information on configuring access control settings, see [Access Control Settings Page, page 16-21](#).
- **Edit Firewall Settings > AuthProxy**—(IOS devices only) To configure AuthProxy settings policies, which configure general settings for authorization proxies. For more information on configuring authorization proxies, see [AAA Page, page 15-25](#).
- **Edit Firewall Settings > Inspection**—(IOS devices only) To configure Inspection settings policies, which configure timeout and session settings for inspection rules. For more information on configuring inspection settings, see [Configuring Settings for Inspection Rules for IOS Devices, page 17-88](#).
- **Edit Firewall Settings > Web Filter**—To configure Web Filter settings policies, which configure the server used for web filtering. For more information on configuring web filter settings, see [Web Filter Settings Page, page 18-16](#).
- **Edit Firewall Settings > Zone Based Firewall**—(IOS 12.4(6)T and higher devices) To configure Zone Based Firewall settings policies, which configure zones and Trend web filter server settings.

## **PART 4**

### **IPS Configuration**

## CHAPTER 35

# Getting Started with IPS Configuration

---

Cisco Intrusion Prevention System (IPS) Sensors are network devices that perform real-time monitoring of network traffic for suspicious activities and active network attacks. The IPS sensor analyzes network packets and flows to determine whether their contents appear to indicate an attack against your network.

Using Cisco Security Manager, you can configure and manage sensors, which can be dedicated stand-alone network appliances, Catalyst 6500 switch modules, service modules running in supported ASA devices or routers, and IPS-enabled Cisco IOS Software images running on integrated services routers. For a full list of supported IPS devices and software versions, see the [Supported Devices and Software Versions for Cisco Security Manager](#) document for this version of the product.

This chapter contains the following topics:

- [Understanding IPS Network Sensing, page 35-1](#)
- [Overview of IPS Configuration, page 35-5](#)
- [Identifying Allowed Hosts, page 35-7](#)
- [Configuring SNMP, page 35-8](#)
- [Managing User Accounts and Password Requirements, page 35-13](#)
- [Identifying an NTP Server, page 35-21](#)
- [Identifying DNS Servers, page 35-22](#)
- [Identifying an HTTP Proxy Server, page 35-23](#)
- [Configuring the External Product Interface, page 35-23](#)
- [Configuring IPS Logging Policies, page 35-26](#)
- [IPS Health Monitor, page 35-27](#)
- [Configuring IPS Security Settings, page 35-29](#)

## Understanding IPS Network Sensing

Network sensing can be accomplished using Cisco IPS sensors (appliances, switch modules, network modules, and SSMs) and Cisco IOS IPS devices (Cisco IOS routers with IPS-enabled images and Cisco ISRs). These sensing platforms are components of the Cisco Intrusion Prevention System and can be managed and configured through Cisco Security Manager. These sensing platforms monitor and analyze network traffic in real time. They do this by looking for anomalies and misuse on the basis of network flow validation, an extensive embedded signature library, and anomaly detection engines. However, these platforms differ in how they can respond to perceived intrusions.

**Tip**

Cisco IPS sensors and Cisco IOS IPS devices are often referred to collectively as IPS devices or simply sensors. However, Cisco IOS IPS does not run the full dedicated IPS software, and its configuration does not include IPS device-specific policies. Additionally, the amount of sensing that you can perform with Cisco IOS IPS is more limited. The following sections focus on using dedicated IPS devices, including service modules installed in IOS routers, rather than Cisco IOS IPS. For a discussion focused on Cisco IOS IPS, see [Intrusion Prevention System \(IPS\) Cisco IOS Intrusion Prevention System Deployment Guide](#) on Cisco.com and [Chapter 44, “Configuring IOS IPS Routers”](#). Also, see <http://www.cisco.com/go/iosips>.

When an IPS device detects unauthorized network activity, it can terminate the connection, permanently block the associated host, and take other actions.

**Note**

For more overview information on IPS sensors, including a comparison of the available appliances and service modules and details about device interfaces, see [Introducing the Sensor](#) in *Installing Cisco Intrusion Prevention System Appliances and Modules*. A list of these documents for each IPS release is available at [http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod\\_installation\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod_installation_guides_list.html).

This section contains the following topics:

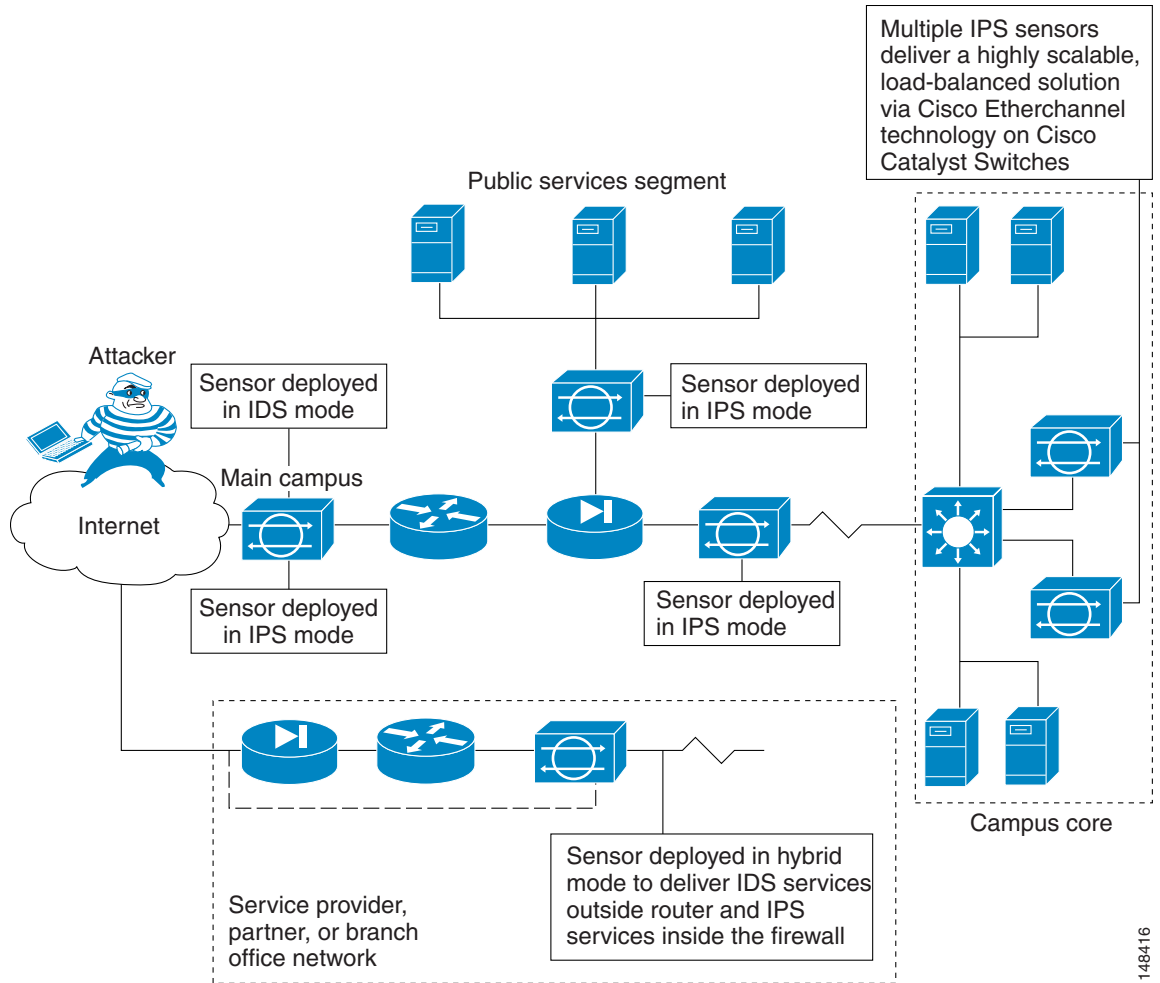

- [Capturing Network Traffic](#), page 35-2
- [Correctly Deploying the Sensor](#), page 35-4
- [Tuning the IPS](#), page 35-4

## Capturing Network Traffic

The sensor can operate in either promiscuous or inline mode. The following illustration shows how you can deploy a combination of sensors operating in both inline (IPS) and promiscuous (IDS) modes to protect your network.

Figure 35-1 Comprehensive IPS Deployment Solutions

The command and control interface is always Ethernet. This interface has an assigned IP address, which allows it to communicate with the manager workstation or network devices (Cisco switches, routers, and firewalls). Because this interface is visible on the network, you should use encryption to maintain data privacy. SSH is used to protect the CLI and TLS/SSL is used to protect the manager workstation. SSH and TLS/SSL are enabled by default on the manager workstations.

When responding to attacks, the sensor can do the following:

- Insert TCP resets via the sensing interface.

**Note** You should select the TCP reset action only on signatures associated with a TCP-based service. If selected as an action on non-TCP-based services, no action is taken. Additionally, TCP resets are not guaranteed to tear down an offending session because of limitations in the TCP protocol.

- Make ACL changes on switches, routers, and firewalls that the sensor manages.

**Note** ACLs may block only future traffic, not current traffic.

- Generate IP session logs, session replay, and trigger packets display.  
IP session logs are used to gather information about unauthorized use. IP log files are written when events occur that you have configured the appliance to look for.
- Implement multiple packet drop actions to stop worms and viruses.

## Correctly Deploying the Sensor

Before you deploy and configure your sensors, you should understand the following about your network:

- The size and complexity of your network.
- Connections between your network and other networks, including the Internet.
- The amount and type of traffic on your network.

This knowledge will help you determine how many sensors are required, the hardware configuration for each sensor (for example, the size and type of network interface cards), and how many managers are needed.

You should always position the IPS sensor behind a perimeter-filtering device, such as a firewall or adaptive security appliance. The perimeter device filters traffic to match your security policy thus allowing acceptable traffic in to your network. Correct placement significantly reduces the number of alerts, which increases the amount of actionable data you can use to investigate security violations. If you position the IPS sensor on the edge of your network in front of a firewall, your sensor will produce alerts on every single scan and attempted attack even if they have no significance to your network implementation. You will receive hundreds, thousands, or even millions of alerts (in a large enterprise environment) that are not really critical or actionable in your environment. Analyzing this type of data is time consuming and costly.

## Tuning the IPS

Tuning the IPS ensures that the alerts you see reflect true actionable information. Without tuning the IPS, it is difficult to do security research or forensics on your network because you will have thousands of benign events, also known as false positives. False positives are a by-product of all IPS devices, but they occur much less frequently in Cisco IPS devices because Cisco IPS devices are stateful, normalized, and use vulnerability signatures for attack evaluation. Cisco IPS devices also provide risk rating, which identifies high risk events, and policy-based management, which lets you deploy rules to enforce IPS signature actions based on risk rating.

Follow these tips when tuning your IPS sensors:

- Place your sensor on your network behind a perimeter-filtering device.  
Proper sensor placement can reduce the number of alerts you need to examine by several thousands a day.
- Deploy the sensor with the default signatures in place.  
The default signature set provides you with a very high security protection posture. The Cisco signature team has spent many hours on testing the defaults to give your sensor the highest protection. If you think that you have lost these defaults, you can restore them.
- Make sure that the event action override is set to drop packets with a risk rating greater than 90.  
This is the default and ensures that high risk alerts are stopped immediately.

- Filter out known false positives caused by specialized software, such as vulnerability scanner and load balancers by one of the following methods:
  - You can configure the sensor to ignore the alerts from the IP addresses of the scanner and load balancer.
  - You can configure the sensor to allow these alerts and then use Event Viewer to filter out the false positives.
- Filter the Informational alerts.
 

These low priority events notifications could indicate that another device is doing reconnaissance on a device protected by the IPS. Research the source IP addresses from these Informational alerts to determine what the source is.
- Analyze the remaining actionable alerts:
  - Research the alert.
  - Fix the attack source.
  - Fix the destination host.
  - Modify the IPS policy to provide more information.

## Overview of IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on dedicated appliances and service modules. For Cisco IOS IPS devices (which does not include IPS service modules installed in a router), see [Overview of Cisco IOS IPS Configuration, page 44-3](#).

---

**Step 1** Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager.

Follow the instructions in the *Installing Cisco Intrusion Prevention System Appliances and Modules* document for the IPS version you are using.

**Step 2** Add the device to the Security Manager device inventory (see [Adding Devices to the Device Inventory, page 3-6](#)).

---

**Tip** You can discover router and Catalyst switch modules when adding the device in which the module is installed. For ASA devices, you must add the service module separately.

---

**Step 3** Configure the interfaces as described in [Configuring Interfaces, page 36-6](#). You must enable the interfaces connected to your network for the device to function.

For certain types of service module, there are additional policies to configure:

- Router-hosted service modules—Configure the **IPS Module** interface settings policy on the router. For more information, see [IPS Module Interface Settings on Cisco IOS Routers, page 59-22](#).

- IDSM—Configure the **IDSM Settings** Catalyst platform policy. For more information, see [IDSM Settings, page 65-44](#).
  - IPS modules on ASA devices—Configure the **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** policy on the host ASA to specify the traffic that should be inspected. For more information, see [About IPS Modules on ASA Devices, page 56-14](#) and [IPS, QoS, and Connection Rules Page, page 56-5](#).
- Step 4** Use the **Virtual Sensors** policy to assign interfaces to the virtual sensors, including the base vs0 virtual sensor that exists for all IPS devices. For information about virtual sensor settings and assigning interfaces to a virtual sensor, see [Defining A Virtual Sensor, page 37-5](#).
- If the device supports it, and you have a need for it, you can also create user-defined virtual sensors so that a single device acts like multiple sensors. Most of the IPS configuration is done on the parent device, but you can configure unique settings per virtual sensor for signatures, anomaly detection, and event actions. For more information, see [Chapter 37, “Configuring Virtual Sensors”](#).
- Step 5** Configure basic device access platform policies. These policies determine who can log into the device:
- **AAA**—Configure this policy if you want to use a RADIUS server to control access to the device. You can use AAA control in conjunction with local user accounts defined in the User Accounts policy. See [Configuring AAA Access Control for IPS Devices, page 35-19](#).
  - **Allowed Hosts**—The addresses of hosts who are allowed access. Ensure that the Security Manager server is included as an allowed host, or you cannot configure the device using Security Manager. See [Identifying Allowed Hosts, page 35-7](#).
  - **SNMP**—Configure this policy if you want to use an SNMP application to manage the device. See [Configuring SNMP, page 35-8](#).
  - **Password Requirements**—You can define the acceptable characteristics of a user password. See [Configuring User Password Requirements, page 35-18](#).
  - **User Accounts**—The user accounts defined on the device. See [Configuring IPS User Accounts, page 35-16](#).
- Step 6** Configure basic server access platform policies. These policies identify the servers to which the device can connect:
- **External Product Interface**—If you use Management Center for Cisco Security Agents, configure this policy to allow the sensor to download host postures from the application. See [Configuring the External Product Interface, page 35-23](#).
  - **NTP**—Configure this policy if you want to use a Network Time Protocol server to control the device time. See [Identifying an NTP Server, page 35-21](#).
  - **DNS, HTTP Proxy**—The DNS and HTTP Proxy policies are required only if you configure global correlation. They identify a server that can resolve DNS names to IP addresses. Use the HTTP Proxy policy if your network requires the use of a proxy to make Internet connections; otherwise, use the DNS policy. See [Identifying DNS Servers, page 35-22](#) or [Identifying an HTTP Proxy Server, page 35-23](#).
- Step 7** Configure the Logging policy if you want non-default logging. See [Configuring IPS Logging Policies, page 35-26](#).
- Step 8** Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:
- [Chapter 39, “Configuring Event Action Rules”](#)
  - [Configuring Signatures, page 38-4](#)

- Step 9** If you use any of the Request Block or Request Rate Limit event actions, configure blocking or rate limiting hosts. See [Configuring IPS Blocking and Rate Limiting, page 42-7](#).
- Step 10** Configure other desired advanced IPS services. See the following topics:
- [Chapter 41, “Configuring Global Correlation”](#)
  - [Configuring Anomaly Detection, page 40-6](#)
- Step 11** Maintain the device:
- Update and redeploy configurations as necessary.
  - Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see [Managing IPS Updates, page 43-4](#).
  - Manage the device licenses. You can update and redeploy licenses, or automate license updates. For more information, see the following topics:
    - [Updating IPS License Files, page 43-1](#)
    - [Redeploying IPS License Files, page 43-2](#)
    - [Automating IPS License File Updates, page 43-3](#)
  - Manage the certificates required for SSL (HTTPS) communication. These certificates expire, so you need to regenerate them approximately every 2 years. For information on regenerating certificates and ensuring that the certificates defined on the device are synchronized with those stored in the Security Manager certificate store, see [Managing IPS Certificates, page 43-10](#).
- Step 12** Monitor the device:
- Use the Event Viewer application to view alerts generated from the device. You can open Event Viewer from the Launch menu in Configuration Manager or Report Manager, or from the Windows Start menu.
    - For information on using Event Viewer, see [Chapter 66, “Viewing Events”](#).
    - For an example of how to filter IPS alerts, see [Removing False Positive IPS Events from the Event Table, page 66-58](#).
  - Use the Report Manager application to generate reports on IPS usage, including comparisons of inline vs. promiscuous mode, and global correlation vs. traditional inspection. You can also analyze top attackers, victims, signatures, blocked signatures, and perform target analysis. The following topics explain Report Manager and the IPS reports in more detail:
    - [Chapter 67, “Managing Reports”](#)
    - [Understanding General IPS Reports, page 67-17](#)
    - [Understanding IPS Top Reports, page 67-16](#)
    - [Opening and Generating Reports, page 67-18](#)

## Identifying Allowed Hosts

Use the Allowed Hosts policy to identify which hosts or networks have permission to access the IPS sensor. By default, no hosts are permitted to access a sensor, so you must add hosts or networks to this policy.

Specifically, you must add either the IP address of the Security Manager server, or its network address, or Security Manager cannot configure the device. Also add the addresses of all other management hosts that you use, such as CS-MARS.

**Tip**

If you add host addresses only, you will be limited to using those workstations to access the device. Instead, you can specify network addresses to allow all hosts connected to specific “safe” networks access.

- 
- Step 1** Do one of the following to open the Allowed Hosts policy:
- (Device view) Select **Platform > Device Admin > Device Access > Allowed Hosts** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Allowed Hosts**, then select an existing policy or create a new one.
- Step 2** Do one of the following:
- To add an entry, click the **Add Row** button and fill in the Access List dialog box. You can add up to 512 entries.
  - To edit an entry, select it and click the **Edit Row** button.
  - To delete an entry, select it and click the **Delete Row** button.
- Step 3** When adding or editing an entry, specify the host or network address in the Add or Modify Access List dialog box, then click **OK**. You can enter addresses using the following formats:
- Host address—A simple IP address, such as 10.100.10.10.
  - Network address—A network address and mask, such as 10.100.10.0/24 or 10.100.10.0/255.255.255.0.
  - A network/host policy object—Click **Select** to select an existing object or to create a new one. To use the object in this policy, it must have a single value, either a single network or a single host.
- 

## Configuring SNMP

SNMP is an application layer protocol that facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

SNMP is a simple request/response protocol. The network-management system issues a request, and managed devices return responses. This behavior is implemented by using one of four protocol operations: Get, GetNext, Set, and Trap.

You can configure the sensor for monitoring by SNMP. SNMP defines a standard way for network management stations to monitor the health and status of many types of devices, including switches, routers, and sensors.

You can configure the sensor to send SNMP traps. SNMP traps enable an agent to notify the management station of significant events by way of an unsolicited SNMP message.

Trap-directed notification has the following advantage—if a manager is responsible for a large number of devices, and each device has a large number of objects, it is impractical to poll or request information from every object on every device. The solution is for each agent on the managed device to notify the manager without solicitation. It does this by sending a message known as a trap of the event.

After receiving the event, the manager displays it and can take an action based on the event. For example, the manager can poll the agent directly, or poll other associated device agents to get a better understanding of the event.

**Tip**

Trap-directed notification results in substantial savings of network and agent resources by eliminating frivolous SNMP requests. However, it is not possible to totally eliminate SNMP polling. SNMP requests are required for discovery and topology changes. In addition, a managed device agent cannot send a trap if the device has had a catastrophic outage.

This procedure describes how to configure SNMP on an IPS sensor so that you can manage the sensor with an SNMP management station, including the configuration of traps.

- Step 1** Do one of the following to open the SNMP policy:
- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one.
- Step 2** On the **General Configuration** tab, configure at least the following options. For a complete description of all available options, see [General SNMP Configuration Options, page 35-10](#).
- **Enable SNMP Gets/Sets**—Select this option to enable the SNMP management workstation to obtain (get) information, and to modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor.
  - **Read-Only Community String**—The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests.
  - **Read-Write Community String**—The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests.
- Step 3** If you want to configure SNMP traps, click the **SNMP Trap Configuration** tab and configure at least the following options. For a complete description of all available options, see [SNMP Trap Configuration Tab, page 35-11](#).
- **Enable Notifications**—Select this option to allow the sensor to send SNMP traps.
  - **Trap Destinations**—Add the SNMP management stations that should be trap destinations. Click the **Add Row (+)** button to add a new destination, or select a destination and click the **Edit Row (pencil)** button to change its configuration.

When adding or editing a trap destination, the trap community string that you enter overrides the default community string entered on the SNMP Trap Configuration tab. The community string appears in the traps sent to this destination and is useful if you are receiving multiple types of traps from multiple agents. For example, a router or sensor could be sending the traps, and if you put something that identifies the router or sensor specifically in your community string, you can filter the traps based on the community string.

To remove a destination, select it and click the **Delete Row (trash can)** button.

- Step 4** If you configure trap destinations, you must also ensure that the desired alerts include the **Request SNMP Trap** action. You have the following options for adding this action:
- (Easy way.) Create an event action override to add the Request SNMP Trap action to all alerts of a specified risk rating (**IPS > Event Actions > Event Action Overrides** policy). For example, you could generate traps for all alerts with a risk rating between 85-100. Event action overrides let you add an action without individually editing each signature. For more information, see [Configuring Event Action Overrides, page 39-13](#).
  - (Precise way.) Edit the Signatures policy (**IPS > Signatures > Signatures**) to add the Request SNMP Trap action to the signatures for which you want to send trap notifications. Traps are sent only for signatures that you configure to send traps.

**Note** If the signature has Default for the source, you have to change the source to the Local source before you can change the action. However, if you right-click the Action cell in the signatures table and select **Edit Actions**, then select Request SNMP Trap (along with any other desired action) and click **OK**, the source is automatically changed to Local.

- Step 5** Add the SNMP management stations to the Allowed Hosts policy. The management stations must be allowed hosts to access the sensor. See [Identifying Allowed Hosts, page 35-7](#).

## General SNMP Configuration Options

Use the General Configuration tab on the SNMP page to configure general SNMP parameters and apply them to IPS sensors. For the procedure, see [Configuring SNMP, page 35-8](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the General Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the General Configuration tab.

### Field Reference

**Table 35-1** General Configuration Tab, SNMP Policy for IPS Sensors

| Element                    | Description                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable SNMP Gets/Sets      | Whether to enable the SNMP management workstation to obtain (get) information, and modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor; the sensor will not respond to SNMP requests.          |
| Read-Only Community String | The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests. Use the string to help identify the sensor. |

**Table 35-1** General Configuration Tab, SNMP Policy for IPS Sensors (Continued)

| Element                     | Description                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Read-Write Community String | The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests. Use the string to help identify the sensor.        |
| Sensor Contact              | The network administrator or contact point who is responsible for this sensor.                                                                                                                                                                                                                                                |
| Sensor Location             | The physical location of the sensor, such as building address, name, and room number.                                                                                                                                                                                                                                         |
| Sensor Agent Port           | The port to use for SNMP get/set communication with the sensor. The default is 161. The valid range is 1 to 65535.<br><br>Enter a port number or the name of a port list object, or click <b>Select</b> to select a port list object from a list or to create a new object. The port list object must identify a single port. |
| SNMP Agent Protocol         | The protocol you are using for SNMP, either UDP (the default) or TCP. Select the protocol used by your SNMP management station.                                                                                                                                                                                               |

## SNMP Trap Configuration Tab

Use the SNMP Trap Communication tab on the SNMP page to configure traps and apply them to sensors and to identify recipients that the traps should be sent to. For the procedure, see [Configuring SNMP](#), page 35-8.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMP Trap Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the SNMP Trap Configuration tab.

### Field Reference

**Table 35-2** SNMP Trap Configuration Tab, SNMP Policy for IPS Sensors

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Notifications | Whether to enable the sensor to send trap notifications to the trap destinations whenever a specific type of event occurs in a sensor. If you do not select this option, the sensor does not send traps.<br><br><b>Tip</b> To have the sensor send SNMP traps, you must also select <b>Request SNMP Trap</b> as the event action when you configure signatures. Traps are sent only for signatures that you configure to send traps. |

**Table 35-2** *SNMP Trap Configuration Tab, SNMP Policy for IPS Sensors (Continued)*

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error Filter                  | The type of events that will generate SNMP traps based on the severity of the event: fatal, error, or warning. Select all severities that you want; use Ctrl+click to select multiple values.<br><br>The sensor sends notifications of events of the selected severities only.                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Detail Traps           | Whether to include the full text of the alert in the trap. If you do not select this option, sparse mode is used. Sparse mode includes less than 484 bytes of text for the alert.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Default Trap Community String | The community string used for the traps if no specific string has been set for the trap destination in the Trap Destinations table.<br><br><b>Tip</b> All traps carry a community string. By default, all traps that have a community string identical to that of the destination are taken by the destination. All other traps are discarded by the destination. However, you can configure the destination to determine which trap strings to accept.                                                                                                                                                                                              |
| Trap Destinations table       | The SNMP management stations that will be sent trap notifications. The table shows the IP address of the management station, the community string added to traps from this sensor, and the port to which traps are sent. <ul style="list-style-type: none"> <li>To add a destination, click the <b>Add Row</b> button and fill in the Add SNMP Trap Communication dialog box (see <a href="#">SNMP Trap Communication Dialog Box</a>, page 35-12).</li> <li>To edit a destination, select it, click the <b>Edit Row</b> button and make your changes.</li> <li>To delete a destination, select it and click the <b>Delete Row</b> button.</li> </ul> |

## SNMP Trap Communication Dialog Box

Use the Add or Modify SNMP Trap Communication dialog box to configure SNMP trap destinations. These are the SNMP management stations that should receive traps from the IPS sensor.

### Navigation Path

Go to the **IPS Platform > Device Admin > Device Access > SNMP** policy, select the **SNMP Trap Configuration** tab, and click the **Add Row** button beneath the Trap Destinations table, or select a destination in the table and click the **Edit Row** button. For more information, see [SNMP Trap Configuration Tab](#), page 35-11.

### Field Reference

**Table 35-3** *SNMP Trap Communication Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | The IP address of the SNMP management station that should receive trap notifications. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new object. The network/host object must specify a single host IP address. |

**Table 35-3** *SNMP Trap Communication Dialog Box (Continued)*

| Element               | Description                                                                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trap Community String | The community string of the trap. If you do not enter a trap string, the default trap string defined on the SNMP Trap Communication tab is used for traps sent to this destination.                                                                |
| Trap Port             | The port used by the SNMP management station to receive traps. Enter the port number or the name of a port list object, or click Select to select the object from a list or to create a new one. The port list object must identify a single port. |

## Managing User Accounts and Password Requirements

You can configure user accounts and passwords, and general password requirements, for your IPS devices. You can configure local users (defined directly on the device), use a RADIUS AAA server, or use them both in conjunction. The policies used are the **AAA**, **User Accounts**, and **Password Requirements** policies in the **Platform > Device Admin > Device Access** folder.

When you create or edit a local user account in Security Manager, the password you enter must satisfy the requirements defined in the Password Requirements policy. This ensures that new passwords meet your security requirements.

**Tip**

If you change the password requirements, and then make changes to any local user account, the new requirements must be met by all user accounts that have passwords managed by Security Manager. This is because Security Manager reconfigures the passwords for all managed accounts if any single account needs to be reconfigured.

The User Accounts policy allows you to centrally manage the local user accounts for your IPS devices. Using a shared policy can help you ensure that all IPS devices contain the same accounts with the same passwords. However, it is important to understand that passwords are encrypted, so Security Manager cannot discover the actual passwords defined on the device. Security Manager manages the passwords for an account only if you define that password in Security Manager. Security Manager does not manage any user accounts defined in a RADIUS AAA server.

The following topics describe IPS user accounts, and Security Manager discovery and deployment considerations, in more detail:

- [Understanding IPS User Roles, page 35-13](#)
- [Understanding Managed and Unmanaged IPS Passwords, page 35-14](#)
- [Understanding How IPS Passwords are Discovered and Deployed, page 35-15](#)
- [Configuring IPS User Accounts, page 35-16](#)
- [Configuring User Password Requirements, page 35-18](#)
- [Configuring AAA Access Control for IPS Devices, page 35-19](#)

## Understanding IPS User Roles

There are four user roles for IPS user accounts:

- **Viewer**—Users can view the device configuration and events, but they cannot modify any configuration data except their user passwords.
- **Operator**—Users can view everything and they can modify the following options:
  - Signature tuning (priority, disable or enable).
  - Virtual sensor definition.
  - Managed routers.
  - Their user passwords.
- **Administrator**—Users can view everything and they can modify all options that Operators can modify in addition to the following:
  - Sensor addressing configuration.
  - List of hosts allowed to connect as configuration or viewing agents.
  - Assignment of physical sensing interfaces.
  - Enable or disable control of physical interfaces.
  - Add and delete users and passwords.
  - Generate new SSH host keys and server certificates.
- **Service**—Only one user with service privileges can exist on a sensor. The service user cannot log in to IDM or IME. The service user logs in to a bash shell rather than the CLI. The service role is a special role that allows you to bypass the CLI if needed.

**Note**

---

The purpose of the Service account is to provide Cisco Technical Support access to troubleshoot unique and unusual problems. It is not needed for normal system configuration and troubleshooting. You should carefully consider whether you want to create a service account. The service account provides shell access to the system, which makes the system vulnerable. However, you can use the service account to create a password if the administrator password is lost. Analyze your situation to decide if you want a service account existing on the system.

---

## Understanding Managed and Unmanaged IPS Passwords

Every IPS local user account has a password, which allows secure user login to the device. These user passwords are encrypted on the IPS device. Thus, when you add an IPS device to the Security Manager inventory, Security Manager cannot read the actual user passwords.

Because Security Manager cannot read the password, it is unable to deploy newly-discovered user account passwords to the device. To avoid putting user accounts into a state where the passwords are unknown and unusable, Security Manager marks discovered user account passwords as **unmanaged**. The status of a password is indicated in the **Is Password Managed?** column of the **Platform > Device Admin > Device Access > User Accounts** policy:

- If **No** is indicated, the password for this account is not configured in Security Manager. When you deploy this policy, Security Manager will not attempt to configure the password for this user account.
- If **Yes** is indicated, the password for this account was configured or updated in Security Manager. When you deploy this policy, Security Manager reconfigures the passwords for all managed accounts, not just the passwords that changed since the last deployment.

Because Security Manager configures even unchanged passwords, all managed passwords must satisfy the password requirements defined in the Password Requirements policy.

Thus, you can have a mix of managed and unmanaged account passwords. For example, you can have a set of shared user accounts that are centrally managed, and manage these account passwords in Security Manager. Other accounts might be unique to individuals; if you never edit these account passwords in Security Manager, the user can manage these passwords individually on the device.

**Tip**

If you do not want to manage any user accounts in Security Manager, ensure that the User Accounts policy is empty, or simply unassign the policy (right-click the policy and select **Unassign Policy**). Security Manager will not modify user account configurations.

## Understanding How IPS Passwords are Discovered and Deployed

Because user passwords are encrypted on IPS devices, Security Manager has to handle them with special care when discovering policies on the device or deploying configurations. When discovering or deploying user accounts on IPS devices, Security Manager does the following:

- **Discovery**—When you add an IPS device to the inventory, or rediscover policies on it, Security Manager determines the current status of each user account, updates the User Account policy with each discovered username and associated role, and marks the user password as unmanaged (as described in [Understanding Managed and Unmanaged IPS Passwords, page 35-14](#)).

You cannot view the account status through Security Manager, because it is dynamic and can change. However, the Discovery Status window displays the status at discovery. Accounts can have these statuses:

- **Active**—This state indicates that the account is available for use. Active accounts can be accessed using an authentication token if one has been assigned to the account.
  - **Expired**—This state indicates that the account's authentication token has expired and the account can not be accessed using a token until the token has been updated.
  - **Locked**—This state indicates that logins to the account have been disabled due to too many failed authentication attempts. You should update the password for these accounts.
- **Deployment**—You are warned if any deployed user accounts are in the Expired or Locked state. Any unmanaged passwords are not deployed to the device. Also, keep in mind the following points:

- If you make changes to any user account on the device, all user accounts with managed passwords are reconfigured. If you also changed the Password Requirements policy, all passwords are compared to the new policy and must meet the new requirements.
- If you change the password of the user account you defined in the device's properties for Security Manager to use when configuring the device, after successful deployment, Security Manager updates the password in the device properties to the new password. You do not need to manually update the password. To see device properties, select **Tools > Device Properties**.

This behavior assumes that you selected **Security Manager Device Credentials** for the Connect to Device Using option on the **Tools > Security Manager Administration > Device Communication** page. If you are using the logged-in users credentials for deployment, after successful deployment, the overall deployment is marked as failed, and a message explains how to reestablish connection. See [Device Communication Page, page 11-16](#).

- If you use out-of-band change detection, changes to passwords are not detected. However, changes to usernames and roles are detected. For more information about out-of-band change detection, see [Detecting and Analyzing Out of Band Changes, page 8-46](#).

- When previewing configurations, you can see changes to the user accounts by selecting to IPS(Delta – User Passwords). However, passwords are masked. For more information, see [Previewing Configurations, page 8-45](#).
- If you are rolling back configurations, the user accounts are never rolled back. The current status and configuration of user accounts does not change.

**Tip**

The IPS sensor can accept public keys for RSA authentication when logging into the device through an SSH client. Each user has an associated list of authorized keys. Users can use these keys instead of passwords. Security Manager ignores these keys during discovery and deployment. Thus, if keys are configured, Security Manager does not remove the configuration.

## Configuring IPS User Accounts

Use the User Accounts policy to configure local user accounts for IPS devices. Users can use these accounts to log into the device. You can create new users, modify user privileges and passwords, and delete users.

The user accounts policy should have at least these accounts:

- cisco—An account named “cisco” must exist on the device and you cannot delete it.
- An administrator account that Security Manager can use—Security Manager must be able to log into the device to configure it. Typically, you create an account for this purpose. However, you have the option of having Security Manager use the user account of the person deploying configurations to log into the device. You can configure this using the **Connect to Device Using** option on the **Tools > Security Manager Administration > Device Communication** page. See [Device Communication Page, page 11-16](#).

IPS user account configuration is more complicated than it seems. Before you configure IPS user accounts, read the following topics:

- [Managing User Accounts and Password Requirements, page 35-13](#)
- [Understanding IPS User Roles, page 35-13](#)
- [Understanding Managed and Unmanaged IPS Passwords, page 35-14](#)
- [Understanding How IPS Passwords are Discovered and Deployed, page 35-15](#)
- [Configuring User Password Requirements, page 35-18](#)
- [Configuring AAA Access Control for IPS Devices, page 35-19](#)

#### Tips

- Cisco IOS IPS devices use the same user accounts that are defined for the router. This procedure does not apply to Cisco IOS IPS configurations.

- If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see [Device Credentials Page, page 3-44](#).

#### Related Topics

- [Filtering Tables, page 1-45](#)
- [Table Columns and Column Heading Features, page 1-46](#)

- 
- Step 1** Do one of the following to open the User Accounts policy:
- (Device view) Select **Platform > Device Admin > Device Access > User Accounts** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Device Access > User Accounts**, then select an existing policy or create a new one.

The policy shows existing user accounts, including the username, role, and whether the password is managed by Security Manager (as explained in [Understanding Managed and Unmanaged IPS Passwords, page 35-14](#)).

- Step 2** Do one of the following:
- To add a user account, click the **Add Row (+)** button. This opens the Add User dialog box. Enter the information required to define the account. For detailed information on the settings, see [Add User and Edit User Credentials Dialog Boxes, page 35-17](#).
  - To edit a user account, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit User dialog box.  
You cannot change a user role to or from the Service role.
  - To delete a user account, select it and click the **Delete Row (trash can)** button. You cannot delete the account named cisco.

**Tip** All password changes must meet the requirements of the Password Requirements policy. If you change the requirements policy, all new user accounts, or edited accounts, are tested against the new requirements. Although the passwords for existing unedited user accounts are not tested, they too must meet the password requirements if you change any user account defined in this policy, because Security Manager will deploy all of the accounts during the next configuration deployment. Passwords are checked for conformity when you validate policies, which typically happens when you submit changes to the database. For more information, see [Understanding How IPS Passwords are Discovered and Deployed, page 35-15](#).

---

## Add User and Edit User Credentials Dialog Boxes

Use the Add User or Edit User Credentials dialog boxes to add or edit IPS device user accounts.

**Navigation Path**

From the IPS platform User Accounts policy, click the **Add Row (+)** button to create a new account, or select an existing account and click the **Edit Row (pencil)** button. For information on accessing the User Accounts policy, see [Configuring IPS User Accounts, page 35-16](#).

**Field Reference****Table 35-4 Add or Edit User Dialog Box**

The name can be 1 to 64 characters, including uppercase and lowercase letters and numbers, plus the special characters ( ) + : , _ / - ] + \$.<br><br>You cannot change the username when editing an account.                                                    |
| Password  | The password for this user account. Enter the password in both fields.                                                                                                                                                                                                                         |
| Confirm   | The password must conform to the Password Requirements policy for IPS devices; see <a href="#">Configuring User Password Requirements, page 35-18</a> .                                                                                                                                        |
| Role      | The role for this user. For an explanation of these roles, see <a href="#">Understanding IPS User Roles, page 35-13</a> .<br><br><b>Tip</b> When editing a user account, you cannot select the Service role. When editing an account assigned to the Service role, you cannot change the role. |

## Configuring User Password Requirements

Use the IPS platform Password Requirements policy to configure the rules for passwords for local IPS device user accounts. All user-created sensor passwords must conform to the requirements defined in this policy. You can configure password requirements for sensor running IPS software version 6.0 or higher.

**Tip**

The requirements you define here determine what is considered an acceptable password in the User Accounts policy (see [Configuring IPS User Accounts, page 35-16](#)). If you change this policy, it can be applied even to unchanged user accounts. For more information about the implications of deploying changes to this policy, see [Understanding How IPS Passwords are Discovered and Deployed, page 35-15](#).

To configure IPS password requirements, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Device Access > Password Requirements** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Password Requirements** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the password requirement options that you can configure.

**Table 35-5 Password Requirements Policy**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attempt Limit                  | How many times a user is allowed to try to log into the device before you lock the user account due to excessive failed attempts.<br><br>The default is 0, which indicates unlimited authentication attempts. For security purposes, you should change this number.                                                                                                                                                                                                                                                                        |
| Size Range                     | The minimum and maximum size allowed for user passwords; separate the minimum and maximum with a hyphen. The range is 6 to 64 characters; the default is 8-64.<br><br><b>Tip</b> If you configure non-zero values for any of the minimum characters options, the minimum size you enter in the Size Range field must be equal to or greater than the sum of those values. For example, you cannot set a minimum password size of eight and also require that passwords must contain at least five lowercase and five uppercase characters. |
| Minimum Digit Characters       | The minimum number of numeric digits that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Minimum Uppercase Characters   | The minimum number of uppercase alphabet characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Minimum Lowercase Characters   | The minimum number of lowercase alphabet characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Minimum Other Characters       | The minimum number of non-alphanumeric printable characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Number of Historical Passwords | The number of historical passwords that you want the sensor to remember for each account. Any attempt to change the password of an account fails if the new password matches any of the remembered passwords. If you specify 0, no previous passwords are remembered.                                                                                                                                                                                                                                                                      |

## Configuring AAA Access Control for IPS Devices

Use the AAA policy to configure AAA access control for your IPS devices. The device must use IPS Software release 7.0(4) or above or 7.1.3 or above to configure AAA; for example, neither 7.1.1 nor 7.1.2 supports AAA.

You can configure the IPS device to use a RADIUS AAA server to authenticate user access to the device. By configuring AAA, you can reduce the number of local users defined on the device and take advantage of your existing RADIUS setup. If you configure a AAA server, you can configure the device to allow local user accounts as a fallback mechanism if the RADIUS servers are unavailable.

When configuring AAA, you identify the RADIUS server using a AAA server policy object. You can create the object while configuring the policy, or you can create it in the Policy Object Manager. When you configure the AAA server object, you must adhere to the following restrictions:

- **Host**—You must specify the IP address; you cannot use a DNS name.
- **Timeout**—If you enter a timeout value, it must be from 1 to 512 seconds. The generic AAA server object allows higher numbers, but IPS has a more limited timeout range. The default is 3.
- **Protocol**—RADIUS is the only supported protocol.

- **Key**— You must specify the shared secret key that is defined on the RADIUS server. Although this field is optional for a generic AAA server object, IPS requires a key.
- **Port**—Ensure that the RADIUS Authentication/Authorization port is correct. Note that the default port in the AAA server object is different from the IPS default, which is 1812. You will need to change the port if you want to use the IPS default.

For more information about configuring AAA server objects, see [Creating AAA Server Objects](#), page 6-29.

#### Tip

You must ensure that the user account configured in the device properties exists in the RADIUS server or as a local user account, depending on the authorization method that you use. If you switch between local and AAA modes, or change AAA servers, you must ensure that the account is defined in whatever user account database you are using. If you are using AAA with local fallback, the account should be defined in all databases. This account must exist, with the same password defined in the Security Manager device properties for the device, or deployment to the device will fail. The user account used for discovery and deployment must have administrator privileges.

#### Related Topics

- [Managing User Accounts and Password Requirements](#), page 35-13
- [Configuring IPS User Accounts](#), page 35-16

#### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > AAA** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > AAA**, then select an existing policy or create a new one.

#### Step 2

Configure the following basic properties:

- **Authentication Mode**—Whether to use Local or AAA mode. Local mode uses user accounts defined on the IPS device only. With AAA mode, the RADIUS servers are the primary means of user authentication, and you can configure local user accounts as a fallback mechanism. The default is Local. You must select AAA to configure any other options in this policy.
- **Primary RADIUS Server, Secondary RADIUS Server**—The main (primary) AAA server and a backup server, if any. Enter the name of the AAA server policy object that identifies the RADIUS server, or click **Select** to select it from a list of objects or to create a new object.

When authenticating users, the IPS device sends the user authentication attempt to the primary server. The secondary server is contacted only if the request to the primary server times out.

#### Step 3

Configure the following optional properties if you want non-default values:

- **Console Authentication**—How you want to authenticate users who access the IPS device through the console:
  - Local—Users connected through the console port are authenticated through local user accounts.
  - Local and RADIUS—Users connected through the console port are authenticated through RADIUS first. If RADIUS fails, local authentication is attempted.
  - RADIUS—Users connected through the console port are authenticated by RADIUS. If you also select Enable Local Fallback, then users can also be authenticated through the local user accounts.

- **RADIUS NAS ID**—The Network Access ID, which identifies the service requesting authentication. The value can be no NAS-ID, cisco-ips, or a NAS-ID already configured on the RADIUS server. The default is cisco-ips.
- **Enable Local Fallback**—Whether you want to fall back to local user account authentication if all RADIUS servers are unavailable. This option is selected by default. Note that local authentication is not attempted if the RADIUS server responds negatively to the logon attempt; local authentication is tried only if no response is received from the RADIUS server.
- **Default User Role**—The role to assign to users who do not have a role assigned in the RADIUS server. You can make Viewer, Operator, or Administrator the default roles, but not Service; select Unspecified to assign no default role (this is the default). For an explanation of user roles, see [Understanding IPS User Roles, page 35-13](#).

**Note** User role configuration is very important. If you do not assign a role to the user, either through the default user role or in the RADIUS server, the sensor prevents user login even if the RADIUS server accepted the username and password.

To assign roles specifically to users on the RADIUS server, you configure the Accept Message for those accounts as either `ips-role=administrator`, `ips-role=operator`, `ips-role=viewer`, or `ips-role=service`. You configure the Accept Message individually for each user account. An example of a Reply attribute for a given user could be configured to return “Hello <user> your ips-role=operator.”

If you configure a service account in the RADIUS server, you must also configure an identical service account locally on the device. For service accounts, both the RADIUS and Local accounts are checked during login.

## Identifying an NTP Server

Use the NTP policy to configure a Network Time Protocol (NTP) server as the time source for the IPS device. Using NTP helps ensure synchronized time among your network devices, which can aid event analysis. NTP is the recommended way to configure time settings on an IPS device.

For detailed information on how to set the time on a sensor, including how to set up a Cisco IOS router as an NTP server, refer to [Configuring Time](#) in *Configuring the Cisco Intrusion Prevention System Sensor Using the Command Line Interface Version 7.0*.

### Tip

Check the time on your IPS sensor if you are having trouble updating your IPS software. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected, and the sensor software update fails.

**Step 1** Do one of the following to open the NTP policy:

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > NTP**, then select an existing policy or create a new one.

**Step 2** In the **NTP Server IP Address** field, enter the IP address of the NTP server. You can also enter the name of a network/host object that identifies the single host address of the server, or click **Select** to select the object from a list or to create a new one.

**Step 3** If the NTP server does not require authentication, deselect the **Authenticated NTP** checkbox.

If the NTP server requires authentication, configure the following options:

- **Authenticated NTP**—Select this option to enable authenticated connections.
- **Key, Confirm**—The key value of the NTP server. The key is an MD5 type of key (either numeric or character); it is the key that was used to set up the NTP server.
- **Key ID**—The key ID value of the NTP server, a numeric value between 1 and 65535.

**Tip** The key and key ID are configured on the NTP server; you must obtain them from the NTP server configuration.

## Identifying DNS Servers

If you configure global correlation on an IPS 7.0+ sensor, the sensor must be able to resolve domain names to successfully connect to the update server when downloading global correlation updates. Use the DNS policy to identify the Domain Name System (DNS) servers that the sensor can use to resolve domain names to IP addresses.

**Tip** If your network requires HTTP proxies when making Internet connections, configure the HTTP Proxy policy instead of the DNS policy. See [Identifying an HTTP Proxy Server, page 35-23](#).

**Note** The AIP-SSC-5 service module does not support DNS servers.

**Step 1** Do one of the following to open the HTTP Proxy policy:

- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > DNS**, then select an existing policy or create a new one.

**Step 2** Specify the IP addresses of up to three DNS servers in the **Primary, Secondary, and Tertiary Address** fields. The sensor uses the servers in the order listed; if one server does not respond, the next server is contacted.

You can enter an IP address or the name of a network/host object that contains a server address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must specify a single host address.

## Identifying an HTTP Proxy Server

If you configure global correlation on an IPS 7.0+ sensor, and your network requires the use of HTTP proxies to connect to the Internet, you need to configure the HTTP Proxy policy to identify a proxy that the IPS sensor can use. When downloading global correlation updates, the IPS sensor connects to the update server using this proxy. The proxy must be able to resolve DNS names.

**Tip**

If you do not use HTTP proxies, configure DNS servers so that the IPS sensor can resolve the address of the update server. See [Identifying DNS Servers, page 35-22](#).

**Note**

The AIP-SSC-5 service module does not support HTTP proxy servers.

**Step 1**

Do one of the following to open the HTTP Proxy policy:

- (Device view) Select **Platform > Device Admin > Server Access > HTTP Proxy** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > HTTP Proxy**, then select an existing policy or create a new one.

**Step 2**

Configure the following options:

- **Enable Proxy**—Select this option to tell the device to connect through the configured proxy server.
- **IP Address**—Enter the IP address of the proxy server, or the name of the network/host object that contains the server's IP address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must contain a single host IP address.
- **Port**—Enter the port number used for HTTP connections to the proxy server. The default is 80.

## Configuring the External Product Interface

Use the External Product Interface policy to configure the way that Security Manager works with Management Center for Cisco Security Agents (CSA MC).

In general, the external product interface is designed to receive and process information from external security and management products. These external security and management products collect information that can be used to automatically enhance the sensor configuration information.

Management Center for Cisco Security Agents is the only external product that can be configured to communicate with the IPS. At most two Management Center for Cisco Security Agents servers can be configured per IPS device.

**Tip**

Management Center for Cisco Security Agents is no longer an active product. Configure this policy only if you are still using that application. For more information, see [About CSA MC](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 6.0* and <http://www.cisco.com/en/US/products/sw/cscowork/ps5212/index.html>.

Management Center for Cisco Security Agents enforces a security policy on network hosts. It has two components:

- Agents that reside on and protect network hosts.
- A management console, which is an application that manages agents. It downloads security policy updates to agents and uploads operational information from agents.

### Before You Begin

Add the external product as an allowed host so that Security Manager allows the sensor to communicate with the external product. For more information, see [Identifying Allowed Hosts, page 35-7](#).

**Step 1** Do one of the following to open the External Product Interface policy:

- (Device view) Select **Platform > Device Admin > Server Access > External Product Interface** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > External Product Interface**, then select an existing policy or create a new one.

The **Management Center for Cisco Security Agents** tab shows any existing definitions, including the IP address (or network/host object), URL, and port of the external application, the username and password used to log into it, and whether the connection is enabled. The interface type is always Extended SDEE.

**Step 2** Do one of the following:

- To add a server, click the **Add Row (+)** button. This opens the External Product Interface dialog box. Enter the information required to identify the server and configure the posture ACLs. For detailed information on the settings, see [External Product Interface Dialog Box, page 35-24](#).

You can add at most two servers.

- To edit a server, select it and click the **Edit Row (pencil)** button and make the required changes in the External Product Interface dialog box.
- To delete a server, select it and click the **Delete Row (trash can)** button.

## External Product Interface Dialog Box

Use the Add or Edit External Product Interface dialog box to add or modify interfaces between Management Center for Cisco Security Agents (CSA MC) and the IPS device and the related posture ACLs.

### Navigation Path

From the External Product Interface IPS platform policy, click **Add Row** or select an entry and click **Edit Row**. For information on opening the External Product Interface policy, see [Configuring the External Product Interface, page 35-23](#).

### Field Reference

**Table 35-6** External Product Interface Dialog Box

| Element                       | Description                                                                                                                                                                                                               |

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Type                    | Identifies the physical interface type, which is always Extended SDEE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable receipt of information     | Whether information is allowed to be passed from the external product to the sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SDEE URL                          | The URL on the CSA MC the IPS uses to retrieve information using SDEE communication. You must configure the URL based on the software version of the CSA MC that the IPS is communicating with as follows: <ul style="list-style-type: none"> <li>• For CSA MC version 5.0—/csamc50/sdee-server.</li> <li>• For CSA MC version 5.1—/csamc51/sdee-server.</li> <li>• For CSA MC version 5.2 and higher—/csamc/sdee-server (the default value).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Port                              | The port, or the port list object that identifies the port, being used for communications. Enter the port or port list name, or click <b>Select</b> to select the object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| User name                         | A username and password that can log into the external product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Password                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable receipt of host postures   | Whether to allow the receipt of host posture information from CSA MC. The host posture information received from a CSA MC is deleted if you disable this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Allow unreachable hosts' postures | Whether to allow the receipt of host posture information for hosts that are not reachable by the CSA MC.<br><br>A host is not reachable if the CSA MC cannot establish a connection with the host on any IP addresses in the host's posture. This option is useful in filtering the postures whose IP addresses may not be visible to the IPS sensor or that might be duplicated across the network. This filter is most applicable in network topologies where hosts that are not reachable by the CSA MC are also not reachable by the IPS, for example if the IPS and CSA MC are on the same network segment.                                                                                                                                                                                                                                                                 |
| Posture ACL table                 | Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network. <ul style="list-style-type: none"> <li>• To add a posture ACL, click the <b>Add Row (+)</b> button. This opens the Add Posture ACL dialog box. For information on configuring the Posture ACL, see <a href="#">Posture ACL Dialog Box, page 35-26</a>.</li> <li>• To edit a posture ACL, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>• To delete a posture ACL, select it and click the <b>Delete Row (trash can)</b> button.</li> <li>• To change the priority of an ACL, select it and click the Up or Down button. ACLs are processed in order, and the action associated with the first match is applied.</li> </ul> |

**Table 35-6 External Product Interface Dialog Box (Continued)**

| Element                                  | Description                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable receipt of watch listed addresses | Whether to allow the receipt of the watch list information from CSA MC. The watch list information received from a CSA MC is deleted if you disable this option. |
| Manual Watch List RR increase            | The percentage of the manual watch list risk rating (RR). The default is 25, and the valid range is 0 to 35.                                                     |
| Session-based Watch List RR Increase     | The percentage of the session-based watch list risk rating. The default is 25, and the valid range is 0 to 35.                                                   |
| Packed-based Watch List RR Increase      | The percentage of the packet-based watch list risk rating. The default is 10, and the valid range is 0 to 35.                                                    |

## Posture ACL Dialog Box

Use the Add or Modify Posture ACL dialog box to configure posture ACLs for Management Center for Security Agents. Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network.

Configure the following fields to define a posture ACL:

- **Network Address**—Enter the IP address of a host or network, or the name of a network/host object that specifies one. You can click **Select** to select the object from a list or to create a new object.
- **Action**—Whether host postures will be permitted or denied from the hosts on the network address.

### Navigation Path

From the External Product Interface dialog box (see [External Product Interface Dialog Box, page 35-24](#)), click the **Add Row (+)** button underneath the Posture ACL table, or select a posture ACL and click the **Edit Row (pencil)** button.

## Configuring IPS Logging Policies

Use the IPS platform Logging policy to configure traffic flow notifications and Analysis Engine global variables. These settings apply to the general operation of the IPS sensor.

Traffic flow notifications have to do with the flow of traffic across the interface of a sensor. You can configure the sensor to monitor the flow of packets across an interface and send notification if that flow changes (starts and stops) during a specified interval. You can configure the missed packet threshold within a specific notification interval and also configure the interface idle delay before a status event is reported.

The Analysis Engine performs packet analysis and alert detection. It monitors traffic that flows through specified interfaces. For the Analysis Engine, there is only one global variable: Maximum Open IP Log Files.

### Navigation Path

- (Device view) Select **Platform > Logging** from the Policy selector.
- (Policy view) Select **IPS > Platform > Logging**, then select an existing policy or create a new one.

**Field Reference****Table 35-7** *IPS Logging Page*

| Element                            | Description                                                                                                                                                                          |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Notifications Tab</b> |                                                                                                                                                                                      |
| Missed Packets Threshold           | The percent of missed packets that has to occur before you want to receive notification. The default is 0, and the range is 0 to 100.                                                |
| Notification Interval              | The length of time, in seconds, that you want to check for the percentage of missed packets. The default is 30, and the range is 5 to 3600.                                          |
| Interface Idle Threshold           | The length of time, in seconds, that you will allow an interface to be idle and not receiving packets before you want to be notified. The default is 30, and the range is 5 to 3600. |
| <b>Analysis Engine Tab</b>         |                                                                                                                                                                                      |
| Maximum Open IP Log Files          | The maximum number of open IP log files that you want to allow on the sensor. The default is 20, and the range is 20 to 100.                                                         |

## IPS Health Monitor

Use the IPS Health Monitor page to configure the metrics, or parameters, that are used to determine the health and network security status of your IPS devices. Your IPS devices use these metrics to assign appropriate severity when sending IPS events. The results appear in the Health and Performance Monitor of Security Manager (Launch > Health and Performance Monitor).

IPS Health Monitor is supported in IPS devices beginning with IPS version 6.1 and in Security Manager beginning with version 4.4. Please note the following special cases:

1. For IPS devices running 7.x, all 11 configuration items in the IPS Security Settings Policy are displayed and monitored properly in the Security Manager GUI.
2. For IPS devices running less than 6.1, the Network Participation and Global Correlation entries are hidden in the device view of Security Manager.
3. Some IPS Health Monitor configuration items are protected entries on the device side itself and cannot be edited. Security Manager informs you in such cases.

If you do not select a metric by checking the check box, it does not appear in the Health and Performance Monitor. You can accept the default configuration or edit the values. Items will be disabled and will not be editable if you do not select a metric.

The overall health is set to the most critical settings of any of the metrics. For instance, if all the selected metrics are normal except for one that is critical, the overall health becomes critical. The IPS sensor sends a health and security status event when the overall health status of the IPS sensor changes.

The security status of the IPS sensor is determined for each virtual sensor using the threat ratings of events detected by the virtual sensors. The security status of the virtual sensor is raised when the virtual sensor detects an event with a threat rating that exceeds the threshold for that virtual sensor. After a threshold has been exceeded, the security status remains at a critical level until the configured amount of time has passed with no more events being detected at the higher level.

To configure the metrics on the IPS Health Monitor page, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Health Monitor** from the Policy selector.

- (Policy view) Select **IPS > Platform > Device Admin > Health Monitor** from the Policy Type selector, then select an existing policy or create a new one.

**Note** In policy view, no validation is performed if a shared IPS Health Monitor policy is applied to an IPS device running less than 6.1. Security Manager ignores such policies during deployment to device and captures them in deployment logs also.

The following table explains the IPS Health Monitor Metrics that you can configure.

**Table 35-8** *IPS Security Settings Policy*

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inspection Load                    | Lets you set a threshold for inspection load and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                             |
| Missed Packet                      | Lets you set a threshold percentage for missed packets and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                   |
| Memory Usage                       | Lets you set a threshold percentage for memory usage and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                     |
| Signature Update                   | Lets you set a threshold for when the last signature update was applied and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                  |
| License Expiration                 | Lets you set a threshold for when the license expires and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                    |
| Event Retrieval                    | Lets you set a threshold for when the last event was retrieved and whether this metric is applied to the overall sensor health rating.<br><br><b>Note</b> The event retrieval metric keeps track of when the last event was retrieved by an external monitoring application such as IME. Disable Event Retrieval if you are not doing external event monitoring. |
| Network Participation              | Lets you choose whether the Network Participation health metrics contribute to the overall sensor health rating.                                                                                                                                                                                                                                                 |
| Global Correlation                 | Let you choose whether the Global Correlation health metrics contribute to the overall sensor health rating.                                                                                                                                                                                                                                                     |
| Application Failure                | Lets you choose to have an application failure applied to the overall sensor health rating.                                                                                                                                                                                                                                                                      |
| IPS in Bypass Mode                 | Let you choose to know if bypass mode is active and have that apply to the overall sensor health rating.                                                                                                                                                                                                                                                         |
| One or More Active Interfaces Down | Lets you choose to know if one or more enabled interfaces are down and have that apply to the overall sensor health rating.                                                                                                                                                                                                                                      |
| Warning                            | Lets you set the lowest threshold in percentage, days, seconds, or failures for the warning threshold.                                                                                                                                                                                                                                                           |
| Critical                           | Lets you set the lowest threshold in percentage, days, seconds, or failures for the critical threshold.                                                                                                                                                                                                                                                          |

# Configuring IPS Security Settings

Use the IPS Security Settings policy to configure two items that are important to the security of your IPS devices:

- **Permit packet capture logging**—With this feature, IPS devices can prevent users from arbitrarily executing packet capture/display/iplog commands. In previous versions of Security Manager, such actions leave no trace of who executed the command.
- **Configurable idle timeout**—When configured, this feature terminates the connection to an IPS device after a period of time that you specify. Its purpose is to increase the security of a CLI session.

## Note

These settings are available for devices operating with IPS 7.1.3 and later.

To configure IPS security settings, select one of the following policies:

- (Device view) Select **Platform > Security > Settings** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Settings** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the IPS security settings that you can configure.

**Table 35-9** *IPS Security Settings Policy*

| Element                             | Description                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------|
| Permit packet logging               | Whether to enable packet logging; applies to packet capture/display/iplog commands. |
| CLI Inactivity Timeout (In Minutes) | Terminates the connection to an IPS device after the specified period of time.      |

## CHAPTER 36

# Managing IPS Device Interfaces

---

Dedicated IPS appliances and service modules have their own interface configuration, whereas Cisco IOS IPS devices are configured using the regular router interface policies. This chapter explains how to configure interfaces for dedicated IPS appliances and service modules only.

This chapter contains the following topics:

- [Understanding Interfaces, page 36-1](#)
- [Understanding Interface Modes, page 36-2](#)
- [Configuring Interfaces, page 36-6](#)

## Understanding Interfaces

Tip

---

This topic is an overview of IPS interfaces. For more detailed information, including the specific interface names and locations for each type of appliance and service module, supported roles, configuration restrictions, and hardware considerations, refer to the “Configuring Interfaces” chapter of the *Installing and Using Cisco Intrusion Prevention System Device Manager* for the IPS software version you are using on Cisco.com. The information is also in the IME and CLI guides. For general information, see <http://www.cisco.com/go/ips>.

---

The sensor interfaces are named according to the maximum speed and physical location of the interface. For example, GigabitEthernet2/1 supports a maximum speed of 1 Gigabit and is the second-from-the-right interface in the second-from-the bottom expansion slot.

There are three interface roles:

- **Command and control**—The command and control interface has an IP address and is used for configuring the sensor. It receives security and status events from the sensor and queries the sensor for statistics.

The command and control interface is permanently enabled. It is permanently mapped to a specific physical interface, which depends on the specific model of sensor. You cannot use the command and control interface as either a sensing or alternate TCP reset interface. See the IPS document cited above for a list of command and control interfaces by device type.

- **Sensing**—Sensing interfaces are used by the sensor to analyze traffic for security violations. A sensor has one or more sensing interfaces depending on the sensor. Sensing interfaces can operate individually in promiscuous mode or you can pair them to create inline interfaces. In promiscuous

mode, packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic. In inline mode, the IPS is in the traffic flow and can directly affect the traffic. For more information about sensing modes, see [Understanding Interface Modes, page 36-2](#).

**Note** On appliances, all sensing interfaces are disabled by default. You must enable them to use them. On modules, the sensing interfaces are permanently enabled. See the IPS document cited above for a list of sensing interfaces by device type.

- **Alternate TCP reset**—You can configure sensors to send TCP reset packets to try to reset a network connection between an attacker host and its intended target host. In some installations when the interface is operating in promiscuous mode, the sensor may not be able to send the TCP reset packets over the same sensing interface on which the attack was detected. In such cases, you can associate the sensing interface with an alternate TCP reset interface and any TCP resets that would otherwise be sent on the sensing interface when it is operating in promiscuous mode are instead sent out on the associated alternate TCP reset interface.

If a sensing interface is associated with an alternate TCP reset interface, that association applies when the sensor is configured for promiscuous mode but is ignored when the sensing interface is configured for inline mode (interface or VLAN pair), because TCP resets are always sent on the sensing interfaces in those modes.

**Note** With the exception of IDSM-2, any sensing interface can serve as the alternate TCP reset interface for another sensing interface. The alternate TCP reset interface on IDSM-2 is fixed because of hardware limitation. However, there is only one sensing interface on IPS modules (on routers or ASA devices), so you cannot specify an alternate TCP reset interface on them. See the IPS document cited above for a list of eligible alternate TCP reset interfaces by device type, and for more information about the conditions under which you would use one.

## Understanding Interface Modes

Sensing interfaces can operate in various modes. The mode configured for an interface determines the traffic it can inspect and how it can respond to events.

This section contains the following topics:

- [Promiscuous Mode, page 36-2](#)
- [Inline Interface Mode, page 36-3](#)
- [Inline VLAN Pair Mode, page 36-3](#)
- [VLAN Group Mode, page 36-4](#)

## Promiscuous Mode

In promiscuous mode, packets do not flow through the sensor. The sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. The advantage of operating in promiscuous mode is that the sensor does not affect the packet flow with the forwarded traffic. The disadvantage of operating in promiscuous mode, however, is the sensor cannot stop malicious traffic from reaching its intended target for certain types of attacks, such as atomic attacks (single-packet attacks). The response actions implemented by promiscuous sensor devices are post-event responses and often require

assistance from other networking devices, for example, routers and firewalls, to respond to an attack. While such response actions can prevent some classes of attacks, in atomic attacks the single packet has the chance of reaching the target system before the promiscuous-based sensor can apply an ACL modification on a managed device (such as a firewall, switch, or router).

By default, all sensing interfaces are in promiscuous mode. To change an interface from inline interface mode to promiscuous mode, delete any inline interface that contains that interface and delete any inline VLAN pair subinterfaces of that interface from the interface configuration.

#### Related Topics

- [Understanding Interfaces, page 36-1](#)
- [Configuring Physical Interfaces, page 36-10](#)

## Inline Interface Mode

Operating in inline interface pair mode puts the IPS directly into the traffic flow and affects packet-forwarding rates making them slower by adding latency. This allows the sensor to stop attacks by dropping malicious traffic before it reaches the intended target, thus providing a protective service. Not only is the inline device processing information on Layers 3 and 4, but it is also analyzing the contents and payload of the packets for more sophisticated embedded attacks (Layers 3 to 7). This deeper analysis lets the system identify and stop or block attacks that would normally pass through a traditional firewall device.

In inline interface pair mode, a packet comes in through the first interface of the pair on the sensor and out the second interface of the pair. The packet is sent to the second interface of the pair unless that packet is being denied or modified by a signature.

#### Notes:

- If the paired interfaces are connected to the same switch, you should configure them on the switch as access ports with different access VLANs for the two ports. Otherwise, traffic does not flow through the inline interface.
- You can configure IPS modules for routers and ASA devices to operate inline even though these modules have only one sensing interface.

#### Related Topics

- [Understanding Interfaces, page 36-1](#)
- [Configuring Inline Interface Pairs, page 36-13](#)

## Inline VLAN Pair Mode

You can associate VLANs in pairs on a physical interface. This is known as inline VLAN pair mode. Packets received on one of the paired VLANs are analyzed and then forwarded to the other VLAN in the pair.

Inline VLAN pair mode is an active sensing mode where a sensing interface acts as an 802.1q trunk port, and the sensor performs VLAN bridging between pairs of VLANs on the trunk. The sensor inspects the traffic it receives on each VLAN in each pair, and can either forward the packets on the other VLAN in the pair, or drop the packet if an intrusion attempt is detected. You can configure an IPS sensor to simultaneously bridge up to 255 VLAN pairs on each sensing interface. The sensor replaces the VLAN

ID field in the 802.1q header of each received packet with the ID of the egress VLAN on which the sensor forwards the packet. The sensor drops all packets received on any VLANs that are not assigned to inline VLAN pairs.

**Notes:**

- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.
- Inline VLAN pairs are not supported on IPS modules for routers or ASA devices.

**Related Topics**

- [Understanding Interfaces, page 36-1](#)
- [Configuring Inline VLAN Pairs, page 36-14](#)

## VLAN Group Mode

You can divide each physical interface or inline interface into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. If you configure multiple virtual sensors, each of them can monitor one or more of these interfaces. This lets you apply multiple policies to the same sensor. The advantage is that now you can use a sensor with only a few interfaces as if it had many interfaces.

**Note**

---

You cannot divide physical interfaces that are in inline VLAN pairs into VLAN groups.

---

VLAN group subinterfaces associate a set of VLANs with a physical or inline interface. No VLAN can be a member of more than one VLAN group subinterface. Each VLAN group subinterface is identified by a number between 1 and 255. Subinterface 0 is a reserved subinterface number used to represent the entire unvirtualized physical or logical interface. You cannot create, delete, or modify subinterface 0 and no statistics are reported for it.

When you create a VLAN group, it is either promiscuous or inline:

- Promiscuous VLAN group—If you configure a VLAN group on a physical interface, the VLAN group is promiscuous, as described in [Promiscuous Mode, page 36-2](#).
- Inline VLAN group—If you configure a VLAN group on an inline interface pair (a logical interface), the VLAN group is inline, as described in [Inline Interface Mode, page 36-3](#).

Thus, VLAN groups augment the operation of promiscuous mode interfaces or inline interfaces by confining their operation to selected VLANs. Once you assign a VLAN group to an interface (physical or inline interface), the interface is no longer a plain promiscuous or inline interface pair and can only be used for inline VLAN groups.

An unassigned VLAN group is maintained that contains all VLANs that are not specifically assigned to another VLAN group. You cannot directly specify the VLANs that are in the unassigned group. When a VLAN is added to or deleted from another VLAN group subinterface, the unassigned group is updated.

Packets in the native VLAN of an 802.1q trunk do not normally have 802.1q encapsulation headers to identify the VLAN number to which the packets belong. A default VLAN variable is associated with each physical interface and you should set this variable to the VLAN number of the native VLAN or to 0. The value 0 indicates that the native VLAN is either unknown or you do not care if it is specified. If the default VLAN setting is 0, the following occurs:

- Any alerts triggered by packets without 802.1q encapsulation have a VLAN value of 0 reported in the alert.

- Non-802.1q encapsulated traffic is associated with the unassigned VLAN group and it is not possible to assign the native VLAN to any other VLAN group.

**Note**

You can configure a port on a switch as either an access port or a trunk port. On an access port, all traffic in a single VLAN is called the access VLAN. On a trunk port, multiple VLANs can be carried over the port, and each packet has a special header attached called the 802.1q header that contains the VLAN ID. This header is commonly referred to as the VLAN tag. However, a trunk port has a special VLAN called the native VLAN. Packets in the native VLAN do not have the 802.1q headers attached. IDSM-2 can read the 802.1q headers for all nonnative traffic to determine the VLAN ID for that packet. However, IDSM-2 does not know which VLAN is configured as the native VLAN for the port in the switch configuration, so it does not know what VLAN the native packets are in. Therefore, you must tell IDSM-2 which VLAN is the native VLAN for that port. Then IDSM-2 treats any untagged packets as if they were tagged with the native VLAN ID.

- [Understanding Interfaces, page 36-1](#)
- [Configuring VLAN Groups, page 36-15](#)

## Deploying VLAN Groups

Because a VLAN group of an inline pair does not translate the VLAN ID, an inline paired interface must exist between two switches to use VLAN groups on a logical interface. For an appliance, you can connect the two pairs to the same switch, make them access ports, and then set the access VLANs for the two ports differently. In this configuration, the sensor connects between two VLANs, because each of the two ports is in access mode and carries only one VLAN. In this case the two ports must be in different VLANs, and the sensor bridges the two VLANs, monitoring any traffic that flows between the two VLANs. IDSM-2 also operates in this manner, because its two data ports are always connected to the same switch.

You can also connect appliances between two switches. There are two variations. In the first variation, the two ports are configured as access ports, so they carry a single VLAN. In this way, the sensor bridges a single VLAN between the two switches.

In the second variation, the two ports are configured as trunk ports, so they can carry multiple VLANs. In this configuration, the sensor bridges multiple VLANs between the two switches. Because multiple VLANs are carried over the inline interface pair, the VLANs can be divided into groups and each group can be assigned to a virtual sensor. The second variation does not apply to IDSM-2 because it cannot be connected in this way.

# Configuring Interfaces

Use the Interfaces policy for IPS appliances and service modules to configure the interface settings for the device. The following topics explain how to configure the various types of settings. These topics do not apply to Cisco IOS IPS devices, which use the standard router interface policies.

- [Understanding the IPS Interfaces Policy, page 36-6](#)
- [Configuring Physical Interfaces, page 36-10](#)
- [Configuring Bypass Mode, page 36-12](#)
- [Configuring CDP Mode, page 36-13](#)
- [Configuring Inline Interface Pairs, page 36-13](#)
- [Configuring Inline VLAN Pairs, page 36-14](#)
- [Configuring VLAN Groups, page 36-15](#)
- [Viewing a Summary of IPS Interface Configuration, page 36-8](#)

## Understanding the IPS Interfaces Policy

Use the Interfaces policy to configure the physical interfaces, inline pairs, VLAN pairs, and VLAN groups on IPS appliances and service modules. This policy does not apply to Cisco IOS IPS devices.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, inline VLAN pair mode, promiscuous VLAN group, or inline VLAN group, but you cannot configure an interface in a combination of these modes.

**Tip**

---

The contents of this policy differ depending on the device type and IPS software version. For example, some devices display the physical interfaces tab only; creating the other types of configurations is not supported. If a tab or option described below does not appear on the policy you are configuring, it does not apply to the device.

---

**Navigation Path**

(Device view only) Select **IPS > Interfaces** from the Policy selector.

| VLAN Pairs tab          | <p>The VLAN pairs for each physical interface, as described in <a href="#">Inline VLAN Pair Mode, page 36-3</a>. The table shows the interface and subinterface, with the two VLANs that are paired, and a description, if any. For more information, see <a href="#">Configuring Inline VLAN Pairs, page 36-14</a>.</p> <ul style="list-style-type: none"> <li>To add a pair, click the <b>Add Row</b> button and fill in the Add VLAN Pair dialog box.</li> <li>To edit a pair, select it and click the <b>Edit Row</b> button.</li> <li>To delete a pair, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                 |
| VLAN Groups tab         | <p>The VLAN groups defined for a physical interface or inline pair, as described in <a href="#">VLAN Group Mode, page 36-4</a>. The table shows the name of the interface or pair, the VLAN group (empty means all unassigned VLANs), and a description, if any. For more information, see <a href="#">Configuring VLAN Groups, page 36-15</a>.</p> <ul style="list-style-type: none"> <li>To add a group, click the <b>Add Row</b> button and fill in the Add VLAN Group dialog box.</li> <li>To edit a group, select it and click the <b>Edit Row</b> button.</li> <li>To delete a group, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                  |

**Table 36-1** *IPS Interfaces Policy (Continued)*

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary tab | <p>A summary of how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, and the interfaces you have configured as inline VLAN pairs.</p> <p>For more information, see <a href="#">Viewing a Summary of IPS Interface Configuration, page 36-8</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Bypass Mode | <p>The bypass mode for the device, which determines how the sensor should handle inline mode traffic when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. This is a global setting that applies to all inline mode interfaces on the device. Select the desired option; for a detailed explanation of how each of these options affect inline traffic, see <a href="#">Configuring Bypass Mode, page 36-12</a>.</p> <ul style="list-style-type: none"> <li>• <b>Off (Always inspect inline traffic)</b>—Disables bypass mode. Traffic is always inspected, and if the monitoring process of the sensor is down, traffic stops flowing.</li> <li>• <b>On (Never inspect inline traffic)</b>—Traffic bypasses the Analysis Engine and is never inspected.</li> <li>• <b>Auto (Bypass inspection when analysis engine is stopped)</b>—Traffic is inspected unless the monitoring process of the sensor is down, in which case traffic continues to flow through the sensor uninspected. This is the default. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor is being upgraded.</li> </ul> |
| CDP Mode    | <p>How to handle Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs). For more information, see <a href="#">Configuring CDP Mode, page 36-13</a>. Select the desired option:</p> <ul style="list-style-type: none"> <li>• <b>Forward CDP packets</b>—To allow CDP packets to pass through the sensor.</li> <li>• <b>Drop CDP packets</b>—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Viewing a Summary of IPS Interface Configuration

The Summary tab of the Interfaces policy contains a table summarizing how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, the interfaces you have configured as inline VLAN pairs, inline VLAN groups, and promiscuous VLAN groups. The content of this table changes when you change your interface configuration.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, or inline VLAN pair mode, but you cannot configure an interface in a combination of these modes.

**Tip**

Not all service modules have a summary tab.

**Navigation Path**

(Device view) Select **Interfaces** from the Policy selector. Click the **Summary** tab.

**Table 36-2** *IPS Interface Summary Tab*

| Element               | Description                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                  | The name of the interface.<br><br>The names are FastEthernet or GigabitEthernet for promiscuous interfaces. For inline interfaces, the name is whatever you assigned to the pair.                                                     |
| Subinterface Number   | The subinterface number of the inline VLAN pair or VLAN group. Subinterface numbers can be from 1 to 255.                                                                                                                             |
| Inline Interface Name | The name of the inline interface pair.                                                                                                                                                                                                |
| Mode                  | The mode for the interface: promiscuous, inline, promiscuous VLAN group, or inline VLAN group and whether there are VLAN pairs. For an explanation of interface modes, see <a href="#">Understanding Interface Modes, page 36-2</a> . |
| VLAN A<br>VLAN B      | The VLAN ID for the first and second VLANs for VLAN pairs. VLAN numbers can be from 1 to 4095.                                                                                                                                        |
| VLAN Range            | The range of VLAN IDs belonging to the VLAN group, for example, 100-200.<br><br>If the VLAN group is configured to apply to all unassigned VLANs, the field is empty.                                                                 |

## Configuring Physical Interfaces

The Physical Interfaces tab of the IPS Interfaces policy lists the existing physical interfaces on your sensor and their associated settings. You cannot add or delete physical interfaces in this policy; instead, you must use policy discovery to obtain the current list of interfaces from the device. Thus, if you add or remove interface cards (available for some appliances), you must rediscover the device as described in [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

To configure the sensor to monitor traffic, you must enable the interface using this procedure. When you initialized the sensor using the **setup** command (using the command line interface on the IPS), you assigned the interface or the inline pair to a virtual sensor, and enabled the interface or inline pair. If you need to change your interfaces settings, you can do so on the Physical Interfaces tab. To assign an interface to a virtual sensor, select the Virtual Sensors policy and add or edit the virtual sensor, as appropriate.

### Tip

Each physical interface can be divided into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. For more information, see [Configuring VLAN Groups, page 36-15](#).

- [Configuring Inline Interface Pairs, page 36-13](#)

- 
- Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **Physical Interfaces** tab (if necessary).
- Step 2** Select the interface whose configuration you want to change and click the **Edit Row** button. The Modify Physical Interface Map dialog box appears.
- Step 3** Make the desired configuration changes and click **OK**. Following are the settings you are most likely to want to change; for a description of all options, see [Modify Physical Interface Map Dialog Box, page 36-11](#).
- **Enabled**—Whether the interface is enabled (**Yes** or **No**). Select Yes to make the interface functional. The value of this option is shown in the Administrative State column in the Physical Interfaces tab.
  - **Default VLAN**—The VLAN to which the interface is assigned.
  - **Specify Interface for TCP Reset**—If you want to assign an alternate TCP reset interface, as described in [Understanding Interfaces, page 36-1](#), select this option, then select the alternate interface from the **interface-name** list.
-

## Modify Physical Interface Map Dialog Box

Use the Modify Physical Interface Map dialog box to change the configuration of the physical interfaces of an IPS sensor. For the procedure, see [Configuring Physical Interfaces, page 36-10](#).

### Navigation Path

(Device view) Select **Interfaces** from the Policy selector. On the **Physical Interfaces** tab, select an interface and click the **Edit Row** button.

**Table 36-3** *Modify Physical Interface Map Dialog Box*

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name         | The name of the physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Media Type   | The type of media for the physical interface. The media types are the following: <ul style="list-style-type: none"> <li>• TX—Copper media.</li> <li>• SX—Fiber media.</li> <li>• XL—Network accelerator card.</li> <li>• Backplane interface—An internal interface that connects the module to the backplane of the parent chassis.</li> </ul>                                                                                                                                         |
| Description  | A description of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enabled      | Whether the interface is enabled, Yes or No.<br>You must select <b>Yes</b> for the interface to be functional. You also have to assign the interface to a virtual sensor for it to monitor traffic; use the Virtual Sensors policy.                                                                                                                                                                                                                                                    |
| Duplex       | The duplex setting of the interface. The duplex types are the following: <ul style="list-style-type: none"> <li>• Auto—Sets the interface to auto negotiate duplex.</li> <li>• Full—Sets the interface to full duplex.</li> <li>• Half—Sets the interface to half duplex.</li> </ul>                                                                                                                                                                                                   |
| Speed        | The speed setting of the interface. The speed options are the following: <ul style="list-style-type: none"> <li>• Auto—Sets the interface to auto negotiate speed.</li> <li>• 10 MB—Sets the interface to 10 MB (for TX interfaces only).</li> <li>• 100 MB—Sets the interface to 100 MB (for TX interfaces only).</li> <li>• 1 GB—Sets the interface to 1 GB (for gigabit interfaces only).</li> <li>• 10 GB—Sets the interface to 10 GB (for 10 gigabit interfaces only).</li> </ul> |
| Default VLAN | The VLAN ID associated with native traffic, or 0 if unknown or if you do not care which VLAN it is.                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 36-3** *Modify Physical Interface Map Dialog Box (Continued)*

| Element                                           | Description                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring Bypass Mode

You can use inline bypass as a diagnostic tool and a failover protection mechanism. Normally, the sensor Analysis Engine performs packet analysis. When inline bypass is activated, Analysis Engine is bypassed, allowing traffic to flow through the inline interfaces and inline VLAN pairs without inspection. Inline bypass ensures that packets continue to flow through the sensor when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. There are three modes: on, off, and automatic. By default, bypass mode is set to automatic.

Keep the following factors in mind before deciding which bypass mode to use:

- There are security consequences when you put the sensor in bypass mode. When bypass mode is on, the traffic bypasses the sensor and is not inspected; therefore, the sensor cannot prevent malicious attacks.
- The inline bypass functionality is implemented in software, so it functions only when the operating system is running. If the sensor is powered off or shut down, inline bypass does not work—traffic does not flow through the sensor.
- When the sensor applies a signature or global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.

To change the bypass mode setting, follow these steps:

---

**Step 1** (Device view) Select the **Interfaces** policy from the Policy selector.

**Step 2** In the **Bypass Mode** field at the bottom of the policy, select the desired option:

- **Off (Always inspect inline traffic)**—Disables bypass mode.  
Traffic flows through the sensor for inspection. If the monitoring process of the sensor is down, traffic stops flowing. This means that inline traffic is always inspected.
- **On (Never inspect inline traffic)**—Traffic bypasses the Analysis Engine and is not inspected. This means that inline traffic is never inspected.
- **Auto (Bypass inspection when analysis engine is stopped)**—Traffic flows through the sensor for inspection unless the monitoring process of the sensor is down. This is the default.

If the monitoring process of the sensor is down, traffic bypasses the sensor until the sensor is running again. The sensor then inspects the traffic. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor is being upgraded. Auto mode also helps to ensure traffic continues to pass through the sensor if the monitoring process fails.

---

## Configuring CDP Mode

You can configure the IPS sensor to enable or disable the forwarding of Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs).

Cisco Discovery Protocol is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment, including routers, access servers, bridges, and switches. Using CDP, a device can advertise its existence to other devices and receive information about other devices on the same LAN or on the remote side of a WAN. CDP runs on all media that support SNAP, including LANs, Frame Relay, and ATM media.

**Tip**

The CDP Mode setting is not available on all IPS appliances and service modules. If the CDP Mode field does not appear on the Interfaces policy, the setting does not apply to the device you are configuring.

---

To change the CDP mode setting on a device, follow these steps:

- 
- Step 1** (Device view) Select the **Interfaces** policy from the Policy selector.
- Step 2** In the **CDP Mode** field at the bottom of the policy, select the desired option:
- **Forward CDP packets**—To allow CDP packets to pass through the sensor.
  - **Drop CDP packets**—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.
- 

## Configuring Inline Interface Pairs

You can pair interfaces on your sensor if your sensor is capable of inline monitoring. For more information about inline pairs, see [Inline Interface Mode, page 36-3](#).

**Tip**

IPS modules for routers and ASA devices do not need an inline pair for monitoring. You only need to add the physical interface to a virtual sensor.

---

**Related Topics**

- [Understanding Interfaces, page 36-1](#)
- [Configuring Bypass Mode, page 36-12](#)
- [Configuring CDP Mode, page 36-13](#)
- [Configuring Physical Interfaces, page 36-10](#)
- [Configuring VLAN Groups, page 36-15](#)

- [Defining A Virtual Sensor, page 37-5](#)
- [Editing Policies for a Virtual Sensor, page 37-9](#)
- [Assigning Interfaces to Virtual Sensors, page 37-4](#)

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **Inline Pairs** tab.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add Interface Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit Interface Pair dialog box opens.

---

**Tip** You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline pair if there is an inline VLAN group. First delete the inline VLAN group from the VLAN Groups tab, and then delete the inline pair.

---

**Step 3** In the Add or Edit Inline Pairs dialog box, configure the following options:

- **Inline Interface Name**—The name you want to give to this inline pair. The name cannot be longer than 32 characters; alphanumeric and underscore characters are allowed. You cannot edit this name after you create the pair.
- **Interface 1 and 2**—Select the two physical interfaces that you want to form a pair. The lists include only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline pair, VLAN pair, or VLAN group.
- **Description**—An optional description for the pair.

**Step 4** Click **OK** to save your changes.

---

## Configuring Inline VLAN Pairs

Use the VLAN Pairs tab of the IPS Interfaces policy to configure the VLAN pairs for physical interfaces. The summary table displays the existing VLAN pairs for each physical interface. You can create multiple VLAN pairs on a single physical interface. For more information about inline VLAN pair mode, see [Inline VLAN Pair Mode, page 36-3](#).

### Tips

- You cannot create a VLAN pair for an interface if it is already part of an inline interface pair; create VLAN groups for inline interface pairs.
- To create an inline VLAN pair for an interface that is in promiscuous mode and assigned to a virtual sensor, you must first remove the interface from the virtual sensor (using the Virtual Sensors policy) and then create the inline VLAN pair.
- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.
- If your sensor does not support inline VLAN pairs, the VLAN Pairs pane is not displayed. IPS modules on routers and ASA devices do not support inline VLAN pairs.
- When using inline VLAN pairs, you should configure UniDirectional Link Detection (UDLD) on the connected switch that is hosting the VLANs. UDLD can help switches prevent spanning-tree forwarding loops and single direction links. For detailed information, see [Configuring UDLD in Installing and Using Intrusion Prevention System Device Manager](#).

**Related Topics**

- [Understanding Interfaces, page 36-1](#)
- [Configuring Bypass Mode, page 36-12](#)
- [Configuring CDP Mode, page 36-13](#)
- [Configuring Physical Interfaces, page 36-10](#)
- [Configuring VLAN Groups, page 36-15](#)

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Pairs** tab.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Pair dialog box opens.

---

**Tip** You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline VLAN pair if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the inline VLAN pair.

---

**Step 3** In the Add or Edit VLAN Pairs dialog box, configure the following options:

- **Physical Interfaces**—Select the physical interface on which you are creating this VLAN pair. The list includes only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline interface pair or VLAN group. However, you can create multiple VLAN pairs on a single interface.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN pair on the selected physical interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the pair.
- **VLAN A, B**—The numbers of the two VLANs that you want to join as a pair. VLAN numbers are from 1 to 4095. You must enter different numbers, and the numbers must not already be part of another VLAN pair on the selected physical interface.

**Step 4** Click **OK** to save your changes.

---

## Configuring VLAN Groups

Use the VLAN Groups tab of the IPS Interfaces policy to configure the VLAN groups for physical interfaces and inline interface pairs (logical interfaces). The summary table displays the existing VLAN groups. You can create multiple VLAN groups on a single physical interface or inline interface pair. For more information about VLAN group mode, see [VLAN Group Mode, page 36-4](#).

A VLAN group consists of a group of VLAN IDs that exist on an interface. Each VLAN group consists of at least one VLAN ID. You can have up to 255 VLAN groups per interface (logical or physical). Each group can contain any number of VLAN IDs.

After you assign the VLAN IDs to the VLAN group, you must assign the VLAN group to a virtual sensor for it to be operational. You can assign a single group to at most one virtual sensor. Use the Virtual Sensors policy to make the assignment.

**Note**

VLAN groups are supported in IPS 6.0 and later only. Not all IPS appliances or service modules support VLAN groups. If the VLAN Groups tab does not appear in the Interfaces policy, the device you are configuring does not support the feature.

**Related Topics**

- [Understanding Interfaces, page 36-1](#)
- [Configuring Bypass Mode, page 36-12](#)
- [Configuring CDP Mode, page 36-13](#)
- [Configuring Physical Interfaces, page 36-10](#)
- [Defining A Virtual Sensor, page 37-5](#)
- [Editing Policies for a Virtual Sensor, page 37-9](#)
- [Assigning Interfaces to Virtual Sensors, page 37-4](#)

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Groups** tab.

The table shows the existing VLAN groups, including the interface for which the group is defined, the subinterface number, description (if any), and the VLANs assigned to the group. If the VLANs cell is empty, the group is defined for all unassigned VLANs on the interface.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Group dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Group dialog box opens.

**Tip**

You can also delete a group by selecting it and clicking the **Delete Row** button. You cannot delete a VLAN group if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the VLAN group.

**Step 3** In the Add or Edit VLAN Group dialog box, configure the following options:

- **Physical and Logical Interfaces**—Select the physical interface or inline interface pair for which you are creating this VLAN group. The list includes only unpaired physical interfaces (defined on the Physical Interfaces tab) that do not already have inline VLAN pairs defined, or inline interface pairs that are defined on the Inline Pairs tab. You can create multiple VLAN groups on a single interface. Keep the following in mind:
  - If you select a physical interface, you are creating a promiscuous VLAN group.
  - If you select a logical interface, you are creating an inline VLAN group.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN group on the selected interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the group.
- **VLAN assignment**—Select one of the following options:
  - **All Unassigned VLAN IDs**—The group contains all VLANs that are not assigned to other VLAN groups. This is the default option

- **Range of free VLAN IDs**—The group contains specific VLANs. In the **Range** box, enter any combination of single VLAN IDs or ranges (separate starting and ending ID with a hyphen), and separate multiple entries with commas. For example, 10, 12-25, 33-49. VLAN numbers are from 1 to 4095.

The VLAN ID cannot already be in another VLAN group for the selected interface. The VLANs also must be configured on the connected switch or there will be no traffic to inspect.

**Step 4** Click **OK** to save your changes.

---

## CHAPTER 37

# Configuring Virtual Sensors

---

All IPS devices and service modules have a base virtual sensor named vs0. When you configure the IPS appliance or service module, you must configure the base vs0 sensor to assign interfaces to it. This assignment tells the device which interfaces to inspect. There are also other settings that are configured on virtual sensors.

In addition to the base vs0 virtual sensor, many IPS appliances and service modules allow you to create user-defined virtual sensors. You can use these virtual sensors to create separate policies for traffic, so that a single physical sensor can act as if it were multiple sensors. A virtual sensor is a logical grouping of sensing interfaces and the configuration policy for the signature engines and event action filters to apply.

This chapter contains the following topics:

- [Understanding the Virtual Sensor, page 37-1](#)
- [Defining A Virtual Sensor, page 37-5](#)
- [Editing Policies for a Virtual Sensor, page 37-9](#)
- [Deleting A Virtual Sensor, page 37-10](#)

## Understanding the Virtual Sensor

The sensor can receive data inputs from one or many monitored data streams. These monitored data streams can either be physical interface ports or virtual interface ports. For example, a single sensor can monitor traffic from in front of the firewall, from behind the firewall, or from in front of and behind the firewall concurrently. A single sensor can monitor one or more data streams. In this situation a single sensor policy or configuration is applied to all monitored data streams.

With virtual sensors, you can create separate policies to apply to specific traffic feeds. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

You configure the following policies and settings separately for a virtual sensor:

- Signature and signature settings (policies in the IPS > Signatures folder).
- Event action policies (policies in the IPS > Event Actions folder).
- Anomaly detection policies (the IPS > Anomaly Detection policy) and the anomaly detection mode (in the Virtual Sensors policy).
- The promiscuous interfaces, inline interface pairs, inline VLAN pairs, inline VLAN groups, or promiscuous VLAN groups that the virtual sensor monitors.

**Note**

No packet is processed by more than one virtual sensor; you cannot assign the same physical or logical interface to more than one sensor. Packets from interfaces, inline interface pairs, inline VLAN pairs, and VLAN groups that are not assigned to any virtual sensor are disposed of according to the inline bypass configuration that you define in the **Interfaces** policy.

- The inline TCP session tracking and Normalizer modes (in the Virtual Sensors policy).

**Note**

If you create a policy instance on an IPS device for signatures, event actions, or anomaly detection but do not assign it to any of the virtual sensors on that device (that is, you do not use that policy instance), then that policy instance is deleted by Security Manager during deployment.

All other policies and settings are configured on the parent device that hosts the virtual sensor. For example, if you want to use global correlation, you configure it on the parent device and the virtual sensors share that configuration.

You can configure up to four virtual sensors on one appliance, but you can add only three user-defined virtual sensors. The first virtual sensor, vs0, is the base sensor and you cannot delete it. In Security Manager, virtual sensors are presented as follows:

- The device selector in Device view contains the parent device, which doubles as the base virtual sensor, vs0. Select this device to configure all device-level policies and to create virtual sensors in the Virtual Sensors policy.
- Any user-defined virtual sensors are also shown in the device selector in Device view. The display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob\_vs1.”

To configure the signature, anomaly detection, and event action policies for a virtual sensor, you must select it in the device selector. You cannot configure these policies by selecting the parent device; those policies on the parent device are for the vs0 base sensor.

The following topics explain more about virtual sensors:

- [Advantages and Restrictions of Virtualization, page 37-3](#)
- [Inline TCP Session Tracking Mode, page 37-3](#)
- [Understanding Normalizer Mode, page 37-4](#)
- [Assigning Interfaces to Virtual Sensors, page 37-4](#)
- [Identifying the Virtual Sensors for a Device, page 37-5](#)
- [Defining A Virtual Sensor, page 37-5](#)
- [Editing Policies for a Virtual Sensor, page 37-9](#)
- [Deleting A Virtual Sensor, page 37-10](#)

## Advantages and Restrictions of Virtualization

An advantage of using virtual sensors is that you can operate more than one virtual sensor on one appliance while configuring each virtual sensor differently with regard to signature behavior and traffic feed. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

Virtualization has the following advantages:

- You can apply different configurations to different sets of traffic.
- You can monitor two networks with overlapping IP spaces with one sensor.
- You can monitor both inside and outside a firewall or NAT device.

Virtualization has the following restrictions:

- You must assign both sides of asymmetric traffic to the same virtual sensor.
- Using VACL capture or SPAN (promiscuous monitoring) is inconsistent with regard to VLAN tagging, which causes problems with VLAN groups.
  - When using Cisco IOS software, a VACL capture port or a SPAN target does not always receive tagged packets even if it is configured for trunking.
  - When using the MSFC, fast path switching of learned routes changes the behavior of VACL captures and SPAN.
- Persistent store is limited.
- Not all IPS sensors support multiple virtual sensors. The Virtual Sensors policy appears for all IPS appliances and service modules, because you must use it to assign interfaces to the base vs0 sensor. If the Add button in the policy is disabled for a device, and you have not configured user-defined virtual sensors, then the device does not support virtualization. Examples of devices that do not support virtualization include the Cisco IPS 4215, NM-CIDS, AIM-IPS, NME-IPS, and AIP-SSC. IDSM2 supports virtualization, but it does not support VLAN groups or inline interface pairs.
- You must use IPS 6.0+ software. Older software versions do not support virtualization.
- Cisco IOS IPS devices do not support virtualization. Use the **IPS > Interface Rules** policy to specify the interfaces that IPS should monitor.

Virtualization has the following traffic capture requirements:

- The virtual sensor must receive traffic that has 802.1q headers (other than traffic on the native VLAN of the capture port).
- The sensor must see both directions of traffic in the same VLAN group in the same virtual sensor for any given sensor.

### Related Topics

- [Understanding the Virtual Sensor, page 37-1](#)
- [Defining A Virtual Sensor, page 37-5](#)

## Inline TCP Session Tracking Mode

When you choose to modify packets inline, if the packets from a stream are seen twice by the Normalizer engine, it cannot properly track the stream state and often the stream is dropped. This situation occurs most often when a stream is routed through multiple VLANs or interfaces that are being monitored by

the IPS. A further complication in this situation is the necessity of allowing asymmetric traffic to merge for proper tracking of streams when the traffic for either direction is received from different VLANs or interfaces.

To deal with this situation, you can set the mode so that streams are perceived as unique if they are received on separate interfaces or VLANs (or the subinterface for VLAN pairs).

The following inline TCP session tracking modes apply:

- **Interface and VLAN**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **VLAN Only**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **Virtual Sensor**—All packets with the same session key (AaBb) within a virtual sensor belong to the same session. This is the default and almost always the best option to choose.

You configure the inline TCP session tracking mode as a property of the virtual sensor as described in [Defining A Virtual Sensor, page 37-5](#).

## Understanding Normalizer Mode

Normalizer mode applies only when the sensor is operating in inline mode. The default is strict evasion protection, which is full enforcement of TCP state and sequence tracking. The Normalizer enforces duplicate packets, changed packets, out-of-order packets, and so forth, which helps prevent attackers from evading the IPS.

Asymmetric mode disables most of the Normalizer checks. Use Asymmetric mode only when the entire stream cannot be inspected, because in this situation, attackers can now evade the IPS.

You configure the Normalizer mode as a property of the virtual sensor as described in [Defining A Virtual Sensor, page 37-5](#).

## Assigning Interfaces to Virtual Sensors

An IPS sensor monitors traffic that traverses interfaces, interface pairs, or VLAN pairs assigned to a virtual sensor.

You can assign one or more of the following types of interfaces to a virtual sensor:

- **Promiscuous interface**—A physical interface that does not have VLAN groups and which is not part of an inline interface pair.
- **Inline interface pair**—A logical interface composed of two physical interfaces.
- **Inline VLAN pair**—A logical interface composed of two VLANs.
- **Promiscuous VLAN group**—A VLAN group that is assigned to a subinterface on a physical interface.

The physical interface cannot already be used for an inline interface or VLAN pair. There can be many promiscuous VLAN groups on the same promiscuous interface, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to a promiscuous interface, it is no longer a plain promiscuous interface and can only be used for promiscuous VLAN groups.

- **Inline VLAN group**—A VLAN group that is assigned to a subinterface of an inline interface pair.

There can be many inline VLAN groups on the same inline interface pair, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to an inline interface pair it is no longer a plain inline interface pair and can only be used for inline VLAN groups.

VLAN groups cannot be assigned to inline VLAN pairs.

You must configure the interfaces before you can assign them to virtual sensors. For more information about configuring all of these types of interfaces, see [Configuring Interfaces, page 36-6](#). For information on assigning interfaces to virtual sensors, see [Defining A Virtual Sensor, page 37-5](#).

## Identifying the Virtual Sensors for a Device

If you configure user-defined virtual sensors on an IPS appliance or service module, the virtual sensor appears in the device selector in Device view.

Normally, the display name of a virtual sensor is in the form *device-name\_virtual-sensor-name*, where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10\_vs1.

Thus, under normal conditions, the virtual sensors for a device should appear immediately after the parent device in the device selector. However, you can change the virtual sensor's display name by editing the device properties. If you alter the default name, the virtual sensors might not appear anywhere near the parent device in the device selector.

You can use the following techniques to identify the virtual sensors defined on a device, or to identify the parent device of a virtual sensor:

- To see a list of virtual sensors defined on an IPS device, select the **Virtual Sensors** policy on the device. The table shows all virtual sensors, including the base vs0 sensor. Note that the vs0 sensor does not appear separately in the device selector; it is represented by the parent device itself.

Unless you radically alter the display names of virtual sensors, the virtual sensor name, along with the parent device's display name, should help you find the virtual sensor in the device selector.

- To determine which IPS device is the host of a virtual sensor, right-click the virtual sensor in the device selector and select **Device Properties**. The Hostname display-only field on the General tab shows the host device display name plus the virtual sensor name as defined on the device.

## Defining A Virtual Sensor

Use the Virtual Sensors policy to configure virtual sensors on your Cisco IPS devices. Even if your IPS device does not support multiple virtual sensors, you must use this policy to assign interfaces to the base sensor, vs0, and configure properties that are associated with the virtual sensor.

**Tip**

---

For Cisco IOS IPS devices, you configure the interfaces that the IPS examines in the **IPS > Interface Rules** policy. You cannot configure virtual sensors in an IOS IPS device.

---

### Before You Begin

Configure the interfaces on the sensor, including inline interface pairs, inline VLAN pairs, and promiscuous and inline VLAN groups. The interface configurations must exist before you can assign them to a virtual sensor. For information on interfaces, interface modes, and how to configure them, see [Chapter 36, "Managing IPS Device Interfaces"](#).

**Related Topics**

- [Advantages and Restrictions of Virtualization, page 37-3](#)
- [Inline TCP Session Tracking Mode, page 37-3](#)
- [Understanding Normalizer Mode, page 37-4](#)
- [Assigning Interfaces to Virtual Sensors, page 37-4](#)
- [Identifying the Virtual Sensors for a Device, page 37-5](#)
- [Editing Policies for a Virtual Sensor, page 37-9](#)

---

**Step 1** (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.

The policy lists all existing virtual sensors, including the base vs0 sensor, which you cannot delete. The information for each sensor shows the interfaces assigned to the sensor, anomaly detection mode, inline TCP tracking mode, normalizer mode, and a description, if any. If the Assignments cell is empty, no interfaces are assigned to the virtual sensor, which means the virtual sensor cannot analyze any traffic.

**Step 2** Do one of the following:

- To add a virtual sensor, click the **Add Row** button. The Add Virtual Sensor dialog box opens.  
You can add at most three sensors. The device supports four virtual sensors, including the base vs0 sensor. If the Add Row button is disabled, you either have configured the maximum number of sensors, or your device does not support multiple virtual sensors.
- To edit a virtual sensor, select it and click the **Edit Row** button. The Edit Virtual Sensor dialog box opens.

---

**Tip** You can also delete a virtual sensor by selecting it and clicking the **Delete Row** button. You cannot delete the base vs0 sensor. For more information about deleting virtual sensors, see [Deleting A Virtual Sensor, page 37-10](#).

---

**Step 3** In the Add or Edit Virtual Sensor dialog box, configure at least the following options. The defaults for the other options are appropriate in most cases. For detailed information on all available options, see [Virtual Sensor Dialog Box, page 37-7](#).

- **Virtual Sensor Name**—The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces.
- **Interface assignments (Available, Assigned lists)**—The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor.
  - To assign interfaces, select them in the available list and click >>.
  - To remove an assignment, select the interface in the assigned list and click <<. You must remove an assignment before you can assign an interface to a different virtual sensor.

**Tip:** If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.

**Step 4** Click **OK** to save your changes and add them to the Virtual Sensors policy.

**Step 5** Click **Save** to save the Virtual Sensors policy.

- Step 6** If you created a new virtual sensor, you must submit your changes to the database for the new virtual sensor to appear in the device selector in Device view.
- Non-Workflow mode—Select **File > Submit**.
  - Workflow mode—Select **Activities > Approve Activity**, or if you are operating with an activity approver, **Activities > Submit Activity**. The activity must be approved before the virtual sensor appears in the device selector.

**Note** In the device selector, the display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob\_vs1.”

- Step 7** To configure the policies associated with a virtual sensor, select it in the device selector in Device view. You can then configure the associated policies. See the following topics:
- [Chapter 38, “Defining IPS Signatures”](#)
  - [Chapter 39, “Configuring Event Action Rules”](#)
  - [Configuring Anomaly Detection, page 40-6](#)

## Virtual Sensor Dialog Box

Use the Add or Edit Virtual Sensor dialog box to configure the properties for a virtual sensor.

### Navigation Path

(Device view only.) Select **Virtual Sensors** from the Policy selector. Click the **Add Row** button, or select an existing virtual sensor and click the **Edit Row** button.

| Virtual Sensor Name                            | <p>The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces. The name of the default virtual sensor is <b>vs0</b>.</p> <p>You cannot change the name after you create the virtual sensor. To change a virtual sensor name, delete the sensor and create a new sensor with the desired name. If you already configured local policies for the sensor (that is, signature, event action, and anomaly detection policies), first save the policies as shared policies, delete the sensor, create the new sensor, then assign the shared policies to the new virtual sensor. For more information about creating shared policies from local policies, see <a href="#">Sharing a Local Policy, page 5-38</a>.</p>                                                                                                                                                                               |
| Interface Assignments<br>(Available, Assigned) | <p>The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor.</p> <ul style="list-style-type: none"> <li>To assign interfaces, select them in the available list and click &gt;&gt;.</li> <li>To remove an assignment, select the interface in the assigned list and click &lt;&lt;. You must remove an assignment before you can assign an interface to a different virtual sensor.</li> </ul> <p><b>Tip</b> If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.</p>                                                                |
| Anomaly Detection Mode                         | <p>The mode that you want the anomaly detection policy to operate in for this virtual sensor: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see <a href="#">Anomaly Detection Modes, page 40-2</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Inline TCP Session Tracking Mode               | <p>The mode used to segregate multiple views of the same stream if the same stream passes through the sensor more than once. The default mode is Virtual Sensor. For more information, see <a href="#">Inline TCP Session Tracking Mode, page 37-3</a>. Select one of the following:</p> <ul style="list-style-type: none"> <li>Interface and VLAN—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.</li> <li>VLAN Only—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.</li> <li>Virtual Sensor—All packets with the same session key (AaBb) within a virtual sensor belong to the same session.</li> </ul> |

Table 37-1 Add or Edit Virtual Sensor Dialog Box (Continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Normalizer Mode | <p>The type of Normalizer mode you need for traffic inspection. For more information, see <a href="#">Understanding Normalizer Mode, page 37-4</a>.</p> <ul style="list-style-type: none"> <li>• <b>Strict Evasion Protection</b>—(Default) If a packet is missed for any reason, all packets after the missed packet are not processed. Strict evasion protection provides full enforcement of TCP state and sequence tracking.</li> </ul> <p>Any out-of-order packets or missed packets can produce Normalizer engine signatures 1300 or 1330 firings, which try to correct the situation, but can result in denied connections.</p> <ul style="list-style-type: none"> <li>• <b>Asymmetric Mode Protection</b>—Can only see one direction of bidirectional traffic flow. Asymmetric mode protection relaxes the evasion protection at the TCP layer.</li> </ul> <p>Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.</p> |
| Description     | The description of the virtual sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Editing Policies for a Virtual Sensor

Virtual sensors have two types of policies: the virtual sensor's properties, and policies assigned to the virtual sensor. You use a different approach to edit these items.

- To edit the properties of a virtual sensor, select the virtual sensor's parent device in the device selector in Device view. Then, select the **Virtual Sensors** policy. You can then select the virtual sensor in the table and click the **Edit Row** button.

Using the Virtual Sensors policy, you can change the interfaces assigned to a sensor, the anomaly detection mode, inline TCP session tracking mode, and Normalizer mode. For more information, see the following topics:

- [Defining A Virtual Sensor, page 37-5](#)
- [Virtual Sensor Dialog Box, page 37-7](#)

- To edit the policies assigned to a virtual sensor, select the virtual sensor in the device selector in Device view. A virtual sensor's name is in the form *device-name\_virtual-sensor-name*, where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10\_vs1.

**Note** The base virtual sensor, vs0, is integrated with the parent device and does not appear separately in the device selector. To configure the base virtual sensor, select the parent device.

You can then select the policies in the Policies selector and configure them. For more information, see the following topics:

- [Chapter 38, “Defining IPS Signatures”](#)

- [Chapter 39, “Configuring Event Action Rules”](#)
- [Configuring Anomaly Detection, page 40-6](#)

All other policies are configured on the parent device, and the configurations apply to all virtual sensors configured on the device.

## Deleting A Virtual Sensor

Virtual sensors appear in the device selector in Device view. However, you cannot delete them from the selector using the same command used for other devices. Instead, you must delete the virtual sensor from the Virtual Sensors policy of the parent device, that is, the device on which the virtual sensor is defined. The following procedure explains how to delete a user-defined virtual sensor.

### Tip

The base virtual sensor, vs0, does not appear in the device selector. Instead, it is represented by the parent IPS sensor; it is considered to be the base IPS device. To delete the base vs0 sensor, you delete the entire device from the inventory. For information on deleting devices from the inventory, see [Deleting Devices from the Security Manager Inventory, page 3-55](#).

### Before You Begin

When you delete a virtual sensor, you also delete the policies defined for the sensor, such as signature, event action, and anomaly detection policies. If you configured non-default local policies, and you want to preserve them for use on other virtual sensors, you must first convert the local policies to shared policies. Then, after you delete the virtual sensor, the policies continue to exist as unassigned shared policies. You can then assign them to another virtual sensor. For more information on creating a shared policy from a local policy, see [Sharing a Local Policy, page 5-38](#).

Using this technique is ideal if you are deleting a virtual sensor simply as a means to change the virtual sensor's name. Because you cannot change a virtual sensor's name, you must delete it and create a new virtual sensor with the desired name. If you created shared policies, you could then assign those shared policies to your new sensor, and it will have the same configuration as the sensor had under the old name.

- 
- Step 1** (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.
  - Step 2** Select the user-defined virtual sensor that you want to delete and click the **Delete Row** button.
  - Step 3** You are asked for a two-step confirmation. First, you are warned that you must save the policy to keep the policy and device synchronized. Click **OK** to continue, and you are also asked to confirm that you want to delete the node.

If you confirm, the virtual sensor is removed from both the policy and the device selector. It will take a few moments before the device view is updated and the virtual sensor disappears from the list of devices.

---

## CHAPTER 38

# Defining IPS Signatures

---

You can use Security Manager to configure IPS signatures for dedicated IPS appliances and service modules or Cisco IOS IPS devices. When configuring signatures for Cisco IOS IPS, keep in mind that the router cannot use as many signatures as a dedicated appliance or service module.

This chapter contains the following topics:

- [Understanding Signatures, page 38-1](#)
- [Configuring Signatures, page 38-4](#)
- [Configuring Signature Settings, page 38-27](#)

## Understanding Signatures

Network intrusions are attacks on, or other misuses of, network resources. Cisco IPS sensors and Cisco IOS IPS devices use a signature-based technology to detect network intrusions. A signature specifies the types of network intrusions that you want the sensor to detect and report. As sensors scan network packets, they use signatures to detect known types of attacks, such as denial of service (DoS) attacks, and respond with actions that you define.

On a basic level, signature-based intrusion detection technology can be compared to virus-checking programs. Cisco IPS contains a set of signatures that the sensor compares with network activity. When a match is found, the sensor takes some action, such as logging the event or sending an alarm to the Security Manager Event Viewer.

Signatures can produce false positives, because certain normal network activity can be construed as malicious. For example, some network applications or operating systems may send out numerous ICMP messages, which a signature-based detection system might interpret as an attempt by an attacker to map out a network segment. You can minimize false positives by editing your signature parameters (tuning your signatures).

To configure a sensor to monitor network traffic for a particular signature, you must enable the signature. By default, the most critical signatures are enabled when you install the signature update. When an attack is detected that matches an enabled signature, the sensor generates an alert, which is stored in the event store of the sensor. The alerts, as well as other events, may be retrieved from the event store by web-based clients such as Event Viewer. By default the sensor logs all Informational alerts or higher.

Some signatures have subsignatures, that is, the signature is divided into subcategories. When you configure a subsignature, changes made to the parameters of one subsignature apply only to that subsignature. For example, if you edit signature 3050 subsignature 1 and change the severity, the severity change applies to only subsignature 1 and not to 3050 2, 3050 3, and 3050 4.

Cisco IPS contains over 10,000 built-in default signatures. You cannot rename or delete signatures from the list of built-in signatures, but you can retire signatures to remove them from the sensing engine. You can later activate retired signatures; however, this process requires the sensing engines to rebuild their configuration, which takes time and could delay the processing of traffic. You can tune built-in signatures by adjusting several signature parameters. Built-in signatures that have been modified are called tuned signatures.

**Note**

We recommend that you retire any signatures that you are not using. This improves sensor performance.

You can create signatures, which are called custom signatures. Custom signature IDs begin at 60000. You can configure them for several things, such as matching of strings on UDP connections, tracking of network floods, and scans. Each signature is created using a signature engine specifically designed for the type of traffic being monitored.

For more about signatures, see:

- [Obtaining Detailed Information About a Signature, page 38-2](#)
- [Understanding Signature Inheritance, page 38-3](#)

**Related Topics**

- [Configuring Signatures, page 38-4](#)
- [Chapter 41, “Configuring Global Correlation”](#)

## Obtaining Detailed Information About a Signature

You can find detailed information about each signature from the [Cisco Security Intelligence Operations](#) web site. The web site includes a wealth of information and best practice recommendations for network security, and you can set up IntelliShield alerts. There is education on advanced security topics to help you protect your network, prioritize remediation, and structure your systems to reduce organizational risk.

When you edit the Signatures policy in Security Manager (see [Signatures Page, page 38-4](#)), the signature ID is linked directly into the Cisco Security Intelligence Operations database of IPS signatures. Clicking a signature ID opens a page containing information about the signature, including a description, the vulnerabilities on which the signature is based, when the signature was created, and so forth. You can search this database yourself at <http://tools.cisco.com/security/center/search.x?search=Signature>. (The database was formerly called the Cisco Network Security Database or NSDB.)

If you do not have access to Cisco.com, then the signature ID is linked to a local copy of the signature database information. Security Manager detects whether you have access to Cisco.com and makes the appropriate link for you without your having to set a preference.

The database includes information only for built-in, default signatures. You cannot find information about custom (user-defined) signatures.

Beginning with Security Manager 4.4, the Signatures Page (IPS > Signatures > Signatures) contains an Explanation tab and a Related Threats tab for each signature. These tabs display detailed information in a separate window on the Signatures page. For example, the Explanation tab displays Description, Signature ID, and so forth; the Related Threats tab displays vulnerabilities for other software that you may be using, and so forth.

**Tip**

If this window is not visible to you, expand it with the up arrow button in the bottom-left corner of the Signatures page. To hide this window, collapse it with the corresponding down arrow, also in the bottom-left corner of the Signatures page. You can resize this window with standard controls.

## Understanding Signature Inheritance

Signature inheritance for IPS devices is different than for any other Security Manager rules-based policy. Inheritance refers to the capability of Security Manager to enforce hierarchical lists of first-match, rule-based policies such as access rules. Signature inheritance is different because for IPS devices, Security Manager allows inheritance on a per-signature basis.

This example shows what is meant by inheritance on a per-signature basis:

- 
- Step 1** In Policy View, select **IPS > Signatures > Signatures**.
  - Step 2** Create a policy named test1.
  - Step 3** Create a second policy, named test2.
  - Step 4** Right-click **test 2** and select **Inherit Signatures**. The Inherit Rules—test 2 dialog box appears.
  - Step 5** Select **test1** and click the **OK** button.
  - Step 6** Select **test1** and edit a signature. Note the edit that you made and save your change.
  - Step 7** Select **test2** and select the signature that you just edited. Observe that test2 inherited the editing that you did on test1.
- 

## IPS Signature Purge

Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database.

**Note**

As a result of the purge operation, you may notice the deletion of some of your unused tuning contexts.

Some of the purged signatures may be restored during your next download of IPS signature packages from Cisco.com.

IPS signature purge is disabled by default. To enable IPS signature purge,

- 
- Step 1** Stop the Cisco Security Manager Daemon Manager: At the command prompt, enter **net stop crmdmgtd**.
  - Step 2** Navigate to *NMSROOT*\MDC\ips\etc\sensorupdate.properties file, where *NMSROOT* is the path to the Security Manager installation directory. The default is C:\Program Files\CSCOpX.
  - Step 3** In sensorupdate.properties, change `purgeUnusedSignaturesEntriesinDB:false` to `purgeUnusedSignaturesEntriesinDB:true`.
  - Step 4** Re-start the Cisco Security Manager Daemon Manager: At the command prompt, enter **net start crmdmgtd**.

IPS signature purge now runs at midnight every day.

---

## Configuring Signatures

The Signatures policy is where you configure signatures for Cisco IPS sensors and Cisco IOS IPS devices.

This section contains the following topics:

- [Signatures Page, page 38-4](#)
- [Viewing Signature Update Levels, page 38-9](#)
- [Enabling and Disabling Signatures, page 38-10](#)
- [Editing Signatures, page 38-11](#)
- [Adding Custom Signatures, page 38-16](#)
- [Cloning Signatures, page 38-18](#)
- [Editing Signature Parameters \(Tuning Signatures\), page 38-19](#)

## Signatures Page

Use the Signatures page to display the signature summary table, in which you can add, edit, and delete IPS signatures. From this page you can tune the active signature set in a policy by enabling or disabling signatures. You can also use this page to unload signatures from the engine.

### Tips

- Disabled signatures are shown with hash marks covering the table row. When you deploy the configuration, disabled signatures are removed from the device. For more information, see [Enabling and Disabling Signatures, page 38-10](#).
- For many columns, you can right-click the column and edit the property directly. Your edits apply to all rows that you have selected. If you select multiple rows, the options that you can select are limited to those that are valid for all selected rows. The contents of the right-click menu differ based on the cell that you right click. For more information on the available commands, see [Signature Shortcut Menu, page 38-7](#).

### Navigation Path

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

### Field Reference

**Table 38-1** *Signature Policy*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID               | The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature. Click the ID number to open a page in your web browser with detailed information about the signature, as explained in <a href="#">Obtaining Detailed Information About a Signature</a> , page 38-2.                                                                                                                                                                                |
| Sub              | The subsignature ID, which is the unique numerical value assigned to this subsignature. A Subsignature ID identifies a more granular version of a broad signature.                                                                                                                                                                                                                                                                                                                                                               |
| Name             | The name assigned to the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Action           | The actions the sensor takes when this signature fires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Severity         | The severity level that the signature reports: High, Medium, Low, or Informational.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Fidelity         | The weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source           | The lowest policy in the inheritance hierarchy that overrides the settings for a signature. Values can be: <ul style="list-style-type: none"> <li>• Default—The signature uses the default Cisco-defined settings.</li> <li>• Local—The signature is defined specifically for the selected device (Device view only.)</li> <li>• Policy name—The lowest shared policy in the inheritance hierarchy. You can see policy names in Policy view, or in Device view if you assign a shared signature policy to the device.</li> </ul> |
| Enabled          | Whether the signature is enabled in this policy; true signifies that it is enabled, false that it is disabled. A signature must be enabled for the sensor to protect against the traffic specified by the signature.                                                                                                                                                                                                                                                                                                             |
| Base Risk Rating | The base risk rating value of the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 38-1 Signature Policy (Continued)

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retired                                      | <p>The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine.</p> <p><b>Timesaver</b> Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device.</p> <p>If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired.</p> <p>If the engine level of a signature policy is equal to E-4, the Retired field has four possible values:</p> <ul style="list-style-type: none"> <li>• <b>false</b>—The signature is not retired.</li> <li>• <b>low-mem-retired</b>—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 MB RAM or less.</li> <li>• <b>med-mem-retired</b>—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 MB RAM or less, but more than 2 MB RAM. (Any device with more than 4 MB RAM is considered a high-memory platform.)</li> <li>• <b>true</b>—The signature is retired on all platforms.</li> </ul> <p>When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired.</p> <p><b>Tip</b> The term <i>engine level</i> used here is not the same as the term <i>engine</i> in the row above.</p> |
| Obsolete                                     | Whether the signature is obsolete. An obsolete signature is removed from the signature engine. It cannot be re-activated. This column is read only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Engine                                       | The engine that parses and inspects the traffic specified by this signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| View Update Level button (Device view only.) | Click this button view the signature update level for this device. For more information, see <a href="#">Viewing Signature Update Levels, page 38-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Export to File button                        | Click this button to export the signature summary for the current device to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Add button                                   | Click this button to add a custom signature. ## Signature Shortcut Menu

Right-clicking inside the signature summary table in the Signatures policy displays a shortcut menu for performing various functions on the selected signatures. Some commands appear only if you select a single signature, while some commands can be used on more than one signature at a time; your changes apply to all selected signatures. For more information about the Signatures policy, see [Signatures Page, page 38-4](#).

Additionally, the available commands differ depending on which cell you right click. Some commands are available when right-clicking any cell, while others are specific to a single cell.

### Tip

When you use a right-click command to change the value in a cell of a Default signature, the signature is converted to a Local signature in Device view or a shared-policy-specific signature in Policy view.

The following table explains the available commands.

**Table 38-2** *Signature Shortcut Menu*

| Menu Command                            | Description                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commands Available for All Cells</b> |                                                                                                                                                                                                                                                                                                                   |
| Add Row                                 | Adds a custom signature. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Adding Custom Signatures, page 38-16</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 38-12</a></li> </ul>                                      |
| Edit Row                                | Edits the selected signature. You can edit one signature at a time. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Editing Signatures, page 38-11</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 38-12</a></li> </ul> |
| Delete Row                              | Deletes the selected custom signatures.<br>You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.                                                                                                                                   |
| Clone                                   | Creates a new custom signature that contains the same properties as the selected signature. For more information, see <a href="#">Cloning Signatures, page 38-18</a> .                                                                                                                                            |

| Menu Command                                                                                                                                      | Description                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable, Disable                                                                                                                                   | Places the signature in the enabled or disabled state, respectively. Disabled signatures appear with crosshatching over them. For more information, see <a href="#">Enabling and Disabling Signatures, page 38-10</a> .                                             |
| Show Events                                                                                                                                       | Enables navigation to the Cisco Security MARS application to view the realtime or historical events detected by the selected signature. For more information, see <a href="#">Viewing CS-MARS Events for an IPS Signature, page 69-30</a> .                         |
| <b>Action Cell Commands</b>                                                                                                                       |                                                                                                                                                                                                                                                                     |
| Add to Actions                                                                                                                                    | Adds an action to the current list of actions for the selected signature.                                                                                                                                                                                           |
| Delete from Actions                                                                                                                               | Deletes an action from the current list of actions for the selected signature.                                                                                                                                                                                      |
| Replace Actions With                                                                                                                              | Replace the current set of actions for the selected signature with the single action selected. If you want to select more than one action, select <b>More</b> from the submenu, then use Ctrl+click to select the desired actions.                                  |
| Edit Actions                                                                                                                                      | Opens the Edit Actions dialog box, where you can select the desired actions for the signature. Your selection replaces the current list of actions for the signature. For more information, see <a href="#">Edit, Add, Replace Action Dialog Boxes, page 38-8</a> . |
| <b>Severity Cell Commands</b>                                                                                                                     |                                                                                                                                                                                                                                                                     |
| <ul style="list-style-type: none"> <li>• High</li> <li>• Medium</li> <li>• Low</li> <li>• Informational</li> </ul>                                | Changes the severity level of the signature to the level you select.                                                                                                                                                                                                |
| <b>Fidelity Cell Commands</b>                                                                                                                     |                                                                                                                                                                                                                                                                     |
| Edit Fidelity                                                                                                                                     | Changes the fidelity rating of the signature, which is the weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                         |
| <b>Retired Cell Commands</b>                                                                                                                      |                                                                                                                                                                                                                                                                     |
| <ul style="list-style-type: none"> <li>• Retire</li> <li>• Activate</li> <li>• Retire on Low Memory</li> <li>• Retire on Medium Memory</li> </ul> | Changes the retired status of the signature to the selected status. For more information about the retired status categories, see <a href="#">Edit Signature or Add Custom Signature Dialog Boxes, page 38-12</a> .                                                 |

## Edit, Add, Replace Action Dialog Boxes

Use the Edit, Add, or Replace Action dialog boxes to change the actions defined for a signature. These dialog boxes are available only when you edit the Action cell using the right click menu as explained in [Signature Shortcut Menu, page 38-7](#). The behavior differs depending on the dialog box name:

- Add Actions—The actions that you select are added to those already defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Add to Actions > More**.

- **Replace Actions**—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Replace Actions With > More**.
- **Edit Actions**—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Edit Actions**.

For an explanation of the available actions, see [Understanding IPS Event Actions, page 39-2](#). You can select multiple actions using Ctrl+click.

**Note**

When you open dialog box, the list of actions that you see varies. The list of actions depends upon whether you right-click in only one signature row in the Actions column or select more than one signature row before right-clicking in the Actions column. If you right-click in only one signature row in the Actions column, the list of actions is that of the engine for that signature. If you select more than one signature row before right-clicking in the Actions column, the list of actions is that which is available for each affected engine. (It is the list of common actions, not the union of actions.)

## Edit Fidelity Dialog Box

Use the Edit Fidelity dialog box to make changes in the Fidelity Rating for a particular signature. The Fidelity Rating, or Signature Fidelity Rating (SFR), identifies the weight associated with how well this signature might perform in the absence of specific knowledge of the target. This rating can be any number from 0 to 100, with 100 indicating the most confidence in the signature.

### Navigation Path

In the Signatures policy, right-click the Fidelity cell in a signature and select Edit Fidelity. For information on opening the Signatures policy, see [Signatures Page, page 38-4](#). For more information on the signature shortcut menu, see [Signature Shortcut Menu, page 38-7](#).

## Viewing Signature Update Levels

In Device view, you can determine the current signature update packages applied to the device in Security Manager and compare it to the one deployed on the device.

Differences between the applied and deployed update levels can occur when:

- The device is updated outside of Security Manager.
- An update is applied to the policy in Security Manager but not yet published to the device.
- During initial Security Manager deployment before the devices are under Security Manager control.

To view the signature update level, select the **IPS > Signatures > Signatures** policy for an IPS device in Device view. Then, click the **View Update Level** button to open the Update Level dialog box.

The following table describes the information displayed in the dialog box.

**Table 38-3** Update Level Dialog Box

| Element       | Description                                                                              |
|---------------|------------------------------------------------------------------------------------------|
| Applied Level | This column displays the patch level that is applied to this device in Security Manager. |

**Table 38-3** Update Level Dialog Box (Continued)

| Element          | Description                                                                                                                                                                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deployed Level   | This column displays the patch level that is currently running on the selected device.                                                                                                                                                                                                             |
| Major Update     | Identifies the major update level.                                                                                                                                                                                                                                                                 |
| Minor Update     | Identifies the minor update level.                                                                                                                                                                                                                                                                 |
| Service Pack     | Identifies the service pack level.                                                                                                                                                                                                                                                                 |
| Patch            | Identifies the patch level.                                                                                                                                                                                                                                                                        |
| Engine           | Identifies the engine level.                                                                                                                                                                                                                                                                       |
| Signature Update | Identifies the signature update level.<br><br><b>Note</b> This field is the only field on this page that applies to the IOS IPS devices; all of the other fields are exclusive to IPS devices.                                                                                                     |
| Revert button    | If you mistakenly modify Applied Level, allows you to discard that new Applied Level; clicking <b>Revert</b> syncs the Applied Level to the Deployed Level.<br><br><b>Tip</b> A warning dialog appears before performing Revert. Also, a warning dialog appears asking you to submit the activity. |

## Enabling and Disabling Signatures

You can enable and disable individual signatures. Your change takes effect when you redeploy the configuration to the device.

If a signature is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled signatures are removed from the device.

Disabling signatures is useful when you want to reduce the number of signatures used by a device, or if you want to temporarily stop using a custom signature without deleting it. You can later reenable a signature that you disabled.

### Note

You can enable a signature that is retired, but it then is not used to scan traffic, because it is not in the signature micro-engine. If you want a sensor to scan network traffic for a particular signature, you must enable it and not retire it. The AIP-SSC-5 does not support enabling a signature that is retired.

### Step 1

Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page, page 38-4](#).

- Step 2** Right-click the signature whose enabled status you want to change and select **Enable** or **Disable**, as appropriate.
- 

## Editing Signatures

You can edit signatures to change their behavior. For example, you can change the action that should be taken when a signature fires, or the severity and fidelity ratings used to calculate the risk rating of the signature.

Some signatures have special requirements. For example, to configure a sensor to detect ACL violation signatures, you must first configure one or more Cisco IOS routers to log ACL violations. Then, you must configure those routers to communicate with the sensor. Finally, you must configure the sensor to accept syslog traffic from those routers.

**Tip**

This procedure describes how to edit an entire signature. You can also selectively edit individual properties of a signature using the right-click menu in the Signatures policy. For information on the available commands, see [Signature Shortcut Menu, page 38-7](#).

---

  - [Cloning Signatures, page 38-18](#)
  - [Configuring Event Action Filters, page 39-4](#)
  - [Chapter 39, “Configuring Event Action Rules”](#)
- 

- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
  - (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page, page 38-4](#).

- Step 2** Right-click the signature you want to edit and select **Edit Row**. You can also select the signature and click the Edit Row (pencil) button beneath the signatures table. The Edit Signature dialog box opens.

**Tip**

Use the filter fields above the table to help you find the desired signature. For information on filtering tables, see [Filtering Tables, page 1-45](#).

---

- Step 3** Make the desired changes to the signature. For specific details about each option, see [Edit Signature or Add Custom Signature Dialog Boxes, page 38-12](#).

When editing signatures, keep the following in mind:

- You cannot edit a Default signature. Default signatures are the Cisco-defined version of a signature. Before you can edit a Default signature, you must convert it either to a Local signature (one defined specifically on the selected device) or a shared-policy-specific signature (one defined in a shared policy). You must select either Local or the shared policy name from the Source Policy field before you can change any field on the Edit Signature dialog box.
- You cannot change every characteristic of a signature. For example, you cannot change the signature or subsignature IDs. These fields are read-only.
- If you want to change the detailed parameters of a signature, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), page 38-19.

**Step 4** Click **OK** to save your changes.

---

## Edit Signature or Add Custom Signature Dialog Boxes

The Edit Signature and Add Custom Signature dialog boxes are essentially the same. Most of the fields are identical, although there are some layout differences. Use these dialog boxes as follows:

- Use the Edit Signature dialog box to edit the characteristics of a non-default signature (you can only view the characteristics of a default signature in read-only mode).  
You cannot edit default signatures. To make any changes to a signature, you must select something other than Default in the Source Policy field at the top of the dialog box.
- Use the Add Custom Signature dialog box to create a custom signature. In the Add Custom Signature dialog box, you enter a name and then select an existing engine from a drop-down list. The signature ID and subsignature ID are assigned by Security Manager. After you finish selecting the remaining parameters, the new signature is added to the Signatures page in the appropriate numerical location, and it is selected.

### Note

Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

---

### Navigation Path

From the Signatures page:

- To edit a signature, right-click the policy you want to edit and select **Edit Row**.
- To add a custom signature, click the **Add Row (+)** button beneath the table, or right-click any row and select **Add Row**.

For information on opening the Signature page, see [Signatures Page](#), page 38-4.

## Field Reference

Table 38-4 Edit Signature or Add Custom Signature Dialog Boxes

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Policy<br>(Edit signature only.)         | The policy in which you are editing the signature: <ul style="list-style-type: none"> <li>• Default—The default Cisco-defined signature, which you cannot edit. You must select something other than Default to edit the signature.</li> <li>• Local—The signature is a local signature defined specifically for the selected device. This option is not available in Policy view.</li> <li>• Policy name (variable)—The name of a shared policy. In Device view, a policy name is available only if you assign a shared policy to the device. In Policy view, this is the name of the policy you are editing. Select the policy name to edit the signature and to have your edits reflected on all devices that are assigned the shared policy.</li> </ul> |
| Name<br>(Add only.)                             | The name of the signature.<br>You cannot change the name after you create the signature. If you want to change the name, you must create a clone of the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SigID<br>(Add only.)                            | The signature ID that you specify while adding a custom signature.<br>The allowed range of values is 60000 - 65000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SubSigID<br>(Add only.)                         | The subsignature ID that you specify while adding a custom signature.<br>The allowed range of values is 0 - 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Inheritance Mandatory<br>(Edit signature only.) | When selected, forces any policy that inherits from this policy to use the signature settings defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enabled                                         | Whether the signature is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Severity                                        | The severity level that the signature will report: High, Medium, Low, or Informational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Fidelity Rating                                 | The weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Actions                                         | The actions that the sensor will take when this signature fires. For a complete list of actions, see the <a href="#">Understanding IPS Event Actions, page 39-2</a> .<br>Use Ctrl+click to select multiple actions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Element                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Base Risk Rating<br>Risk Rating<br>(Fields have slightly different names when adding or editing signatures.) | <p>The base risk rating value of the signature, which is calculated by multiplying the fidelity rating and the severity factor and dividing them by 100 (Fidelity Rating x Severity Factor /100). This value is read only; you cannot directly change it. To change the value, alter the Severity and Fidelity fields.</p> <p>The Severity Factor has the following values based on what you select in the Severity field:</p> <ul style="list-style-type: none"> <li>• High = 100</li> <li>• Medium = 75</li> <li>• Low = 50</li> <li>• Informational = 25</li> </ul>                                                                |
| Engine<br>(Read-only when editing; read-write when adding custom signatures.)                                | <p>The engine that parses and inspects the traffic specified by this signature. For a description of the engines, see <a href="#">Engine Options, page 38-17</a>.</p> <p>When adding a custom signature, you must select the appropriate engine. For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the <i>Installing and Using Cisco Intrusion Prevention System Device Manager</i> document for the IPS Software release you are using.</p> <p><b>Tip</b> The term <i>engine</i> used here is not the same as the term <i>engine level</i> used in the row below.</p> |

| Element                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retired                                                                          | <p>The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine.</p> <p><b>Timesaver</b> Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device.</p> <p>If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired.</p> <p>If the engine level of a signature policy is equal to E-4, the Retired field has four possible values:</p> <ul style="list-style-type: none"> <li>• <b>false</b>—The signature is not retired.</li> <li>• <b>low-mem-retired</b>—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 MB RAM or less.</li> <li>• <b>med-mem-retired</b>—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 MB RAM or less, but more than 2 MB RAM. (Any device with more than 4 MB RAM is considered a high-memory platform.)</li> <li>• <b>true</b>—The signature is retired on all platforms.</li> </ul> <p>When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired.</p> <p><b>Tip</b> The term <i>engine level</i> used here is not the same as the term <i>engine</i> in the row above.</p> |
| Obsolete<br>(Edit signature only.)                                               | Identifies whether the signature is obsolete. An obsolete signature is removed from the signature engine. It cannot be re-activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Restore Defaults button<br>(Non-custom signatures only.<br>Edit signature only.) | Click this button to revert to default values for this signature as defined by Cisco.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Edit Parameters button                                                           | <p>Click this button to edit the detailed parameters for this signature using the Edit Signature Parameters dialog box. For more information, see the following topics:</p> <ul style="list-style-type: none"> <li>• <a href="#">Edit Signature Parameters Dialog Box, page 38-21</a></li> <li>• <a href="#">Editing Signature Parameters (Tuning Signatures), page 38-19</a></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Adding Custom Signatures

If you want to look for traffic patterns that are not identified by the built-in signatures, you can create your own custom signatures to define the traffic patterns.

Even if a built-in signature covers the traffic pattern, you might want to create a custom signature to edit the detailed signature parameters without altering the default signature. If you are creating a custom signature that is similar to an existing signature, the easiest way to do it is to clone the signature as described in [Cloning Signatures, page 38-18](#).

---

**Note** The AIP-SSC-5 does not support custom signatures.

---

**Step 1** Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page, page 38-4](#).

**Step 2** Click the **Add Row (+)** button beneath the signature table to open the Add Custom Signature dialog box.

**Step 3** Configure the desired settings. For specific details about each option, see [Edit Signature or Add Custom Signature Dialog Boxes, page 38-12](#).

When creating signatures, keep the following in mind:

- You cannot change the signature name after you define the signature. If you later want to change the name, you must clone the signature and change it while creating the clone.
- Select the appropriate signature engine for the signature. For a description of the signature engines, see [Engine Options, page 38-17](#). You cannot change the engine after you create the signature; if you select the wrong engine and click OK to save the signature, you must start over and create an entirely new signature.
- The default is to create an enabled signature, but you can deselect the Enabled check box to initially create a disabled signature. You might want to disable the signature if you have not finished editing its parameters.
- Follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\), page 38-19](#) to define the detailed signature parameters. You must select the desired engine before you edit the parameters, because many of the parameters are determined by the signature engine.

Whether you can save the signature before configuring parameters differs based on the engine that you select. At minimum, you must click **Edit Parameters** to open the Edit Signature Parameters dialog box, and then click **OK** in the Edit Signature Parameters dialog box, before you can save the signature definition. However, to create a meaningful signature, you will need to configure the parameters to identify the desired traffic pattern.

**Step 4** Click **OK** to save your changes.

The custom signature is added to the end of the table and given the next available signature ID starting at 60000.

**Note**

Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

## Engine Options

The following list identifies the options you can specify in the Engine field of the Edit Signature Parameters dialog box. For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the *Installing and Using Cisco Intrusion Prevention System Device Manager* document for the IPS Software release you are using.

- AIC FTP—Inspects FTP traffic and lets you control the commands being issued.
- AIC HTTP—Provides granular control over HTTP sessions to prevent abuse of the HTTP protocol.
- Atomic ARP—Inspects Layer-2 ARP protocol. The Atomic ARP engine is different because most engines are based on Layer-3-IP.
- atomic-ip—Inspects IP protocol packets and associated Layer-4 transport protocols.
- Atomic IPv6—Detects IOS vulnerabilities that are stimulated by malformed IPv6 traffic.
- Flood Host—Detects ICMP and UDP floods directed at hosts.
- Flood Net—Detects ICMP and UDP floods directed at networks.
- Meta—Defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets.
- multi-string—Defines signatures that inspect Layer 4 transport protocol (ICMP, TCP, and UDP) payloads using multiple string matches for one signature. You can specify a series of regular expression patterns that must be matched to fire the signature.
- normalizer—Configures how the IP and TCP normalizer functions and provides configuration for signature events related to the IP and TCP normalizer. Allows you to enforce RFC compliance.
- service-dns—Inspects DNS (TCP and UDP) traffic.
- service-ftp—Inspects FTP traffic.
- Service Generic—Decodes custom service and payload.

The Service Generic engine allows programmatic signatures to be issued in a config-file-only signature update. It has a simple machine and assembly language that is defined in the configuration file. It runs the machine code (distilled from the assembly language) through its virtual machine, which processes the instructions and pulls the important pieces of information out of the packet and runs them through the comparisons and operations specified in the machine code. It is intended as a rapid signature response engine to supplement the String and State engines.

You cannot use the Service Generic engine to create custom signatures.

**Note**

Due to the proprietary nature of this complex language, we do not recommend that you edit the Service Generic engine signature parameters. Change only the severity and event action for these signatures.

- Service Generic Advanced—Generically analyzes network protocols.

- Service H225—Inspects VoIP traffic.
- service-http—Inspects HTTP traffic. The WEBPORTS variable defines inspection port for HTTP traffic.
- Service IDENT—Inspects IDENT (client and server) traffic.
- Service MSRPC—Inspects MSRPC traffic.
- Service MSSQL—Inspects Microsoft SQL traffic.
- Service NTP—Inspects NTP traffic.
- service-rpc—Inspects RPC traffic.
- Service SMB—Inspects SMB traffic.
- Service SMB Advanced—Processes Microsoft SMB and Microsoft RPC over SMB packets.
- Service SNMP—Inspects SNMP traffic.
- Service SSH—Inspects SSH traffic.
- Service TNS—Inspects TNS traffic.
- state—Stateful searches of strings in protocols such as SMTP.
- string-icmp—Searches on Regex strings based on ICMP protocol.
- string-tcp—Searches on Regex strings based on TCP protocol.
- string-udp—Searches on Regex strings based on UDP protocol.
- Sweep—Analyzes sweeps of ports, hosts, and services, from a single host (ICMP and TCP), from destination ports (TCP and UDP), and multiple ports with RPC requests between two nodes.
- Sweep Other TCP—Analyzes TCP flag combinations from reconnaissance scans that are trying to get information about a single host. The signatures look for flags A, B, and C. When all three are seen, an alert is fired.
- Traffic ICMP—Analyzes nonstandard protocols, such as TFN2K, LOKI, and DDOS. There are only two signatures with configurable parameters.
- Traffic Anomaly—Analyzes TCP, UDP, and other traffic for worm-infested hosts.
- Trojan Bo2k—Analyzes traffic from the nonstandard protocol BO2K. There are no user-configurable parameters in this engine.
- Trojan Tfn2k—Analyzes traffic from the nonstandard protocol TFN2K. There are no user-configurable parameters in this engine.
- Trojan UDP—Analyzes traffic from the UDP protocol. There are no user-configurable parameters in this engine.

## Cloning Signatures

If you want to create a custom signature that is similar to an existing signature, you can create a clone, or copy, of the signature. You can then edit the parameters to make the clone perform according to your requirements.

For example, you might want to create a clone of a Cisco-defined signature to customize it to your needs. You might find this preferable to converting the Cisco signature to a Local or shared policy signature and directly editing its parameters.

To clone a signature, follow these steps:

- 
- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
  - (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page, page 38-4](#).

- Step 2** Right-click the signature that you want to clone and select **Clone**.
- Security Manager takes some time to make the copy, and might warn you that some attributes are read-only and cannot be copied. If you receive a warning, click **OK**. The Add Custom Signature dialog box then appears.
- Step 3** Edit the properties of the cloned signature, as described in [Adding Custom Signatures, page 38-16](#).
- Step 4** Click **OK**. The clone appears in the summary table on the Signatures page as the last signature. Cloned signatures are enabled and active by default.
- 

## Editing Signature Parameters (Tuning Signatures)

If you cannot alter the behavior of a signature to fit your needs using the Event Action Filters and Overrides policies, or by changing the actions associated with a signature, you might need to fine-tune the signature parameters. You should consider editing parameters to be your last option, however, because these parameters can be complex and frequently require that you have a deep understanding of packet characteristics.

The reason you would want to edit parameters is to reduce false positives and false negatives:

- A *false positive* occurs when legitimate network activity, such as virus scanning, is interpreted and reported as an attack. This happens when network activity meets criteria that were specified to identify an attack before the attack occurred. You can decrease the number false positives by tuning your sensor configurations.
- A *false negative* occurs when an attack was not detected. Tuning your sensor configurations will help you decrease the number of false negatives.

### Tip

---

You cannot edit the parameters of a default signature. Before editing the parameters of a default signature, you must convert the signature to a local- or shared-policy signature. In some cases, such as regular expression editing, you must clone the signature and convert it to a custom signature.

---

This procedure describes how to edit signature parameters to tune a signature.

### Related Topics

- [Editing Signatures, page 38-11](#)
- [Understanding Signatures, page 38-1](#)
- [Configuring Event Action Filters, page 39-4](#)
- [Configuring Event Action Overrides, page 39-13](#)

**Step 1** Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page, page 38-4](#).

**Step 2** Right-click the signature whose parameters you want to edit and select **Edit Row**. The Edit Signature dialog box appears (see [Edit Signature or Add Custom Signature Dialog Boxes, page 38-12](#)).

**Step 3** If the Source Policy field shows Default, you must change it to Local or to the name of a shared policy before you can edit the parameters. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

**Step 4** Click **Edit Parameters**. The Edit Signature Parameters dialog box appears.

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated field in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see [Editing the Component List for Meta Engine Signatures, page 38-25](#).
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

For more information about the Edit Signature Parameters dialog box, see [Edit Signature Parameters Dialog Box, page 38-21](#).

**Step 5** Change the settings as desired, then click **OK** to save your changes. You are returned to the Edit Signature dialog box.

**Step 6** Click **OK** in the Edit Signature dialog box to save your changes to the signature.

**Tip**

If you decide that your edits did not have the desired effect, or you suspect that you made a mistake, you can click the **Restore Defaults** button in the Edit Signature dialog box to erase your changes. You can then start over.

## Edit Signature Parameters Dialog Box

Use the Edit Signature Parameters dialog box to edit (also called tune) the built-in micro-engine parameters for a particular signature. Different engines have different parameters, so the appearance of the Edit Signature Parameters dialog box varies. For more information about editing signature parameters, see [Editing Signature Parameters \(Tuning Signatures\), page 38-19](#).

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated field in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see [Editing the Component List for Meta Engine Signatures, page 38-25](#).
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

**Navigation Path**

From the Edit Signature or Add Custom Signature dialog boxes, click the **Edit Parameters** button. For information on opening these dialog boxes, see [Edit Signature or Add Custom Signature Dialog Boxes](#), page 38-12.

**Tip**

If the button is not active, you must first select Local or the name of a shared policy from the Source Policy field, or clone the signature to create a custom policy. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

**Field Reference**

**Table 38-5** *Edit Signature Parameters Dialog Box*

| Elements                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tuning Context<br>(Policy view only) | <p>Displays the information needed by Security Manager to uniquely describe how the signature parameters were edited (tuned) for a particular signature policy. The Tuning Context field is a character string that contains the following items:</p> <ul style="list-style-type: none"> <li>• <b>Context</b>—The identification given by the Security Manager server for the unique definition of this micro-engine.</li> <li>• <b>SigLevel (IPS) or Version (IOS IPS)</b>—For IPS policies, the range of signature update levels to which this definition of the signature micro-engine applies. For IOS IPS, this is the IOS IPS version.</li> <li>• <b>Engine</b>—The name of the IPS engine.</li> </ul> <p><b>Tip</b> As an example, the Tuning Context field could contain the following character string: Context:9, SigLevel:302-449, Engine:atomic-ip.</p> <p>For any particular signature policy, the Tuning Context field can contain one or many tuning contexts:</p> <ul style="list-style-type: none"> <li>• The tuning context with the highest signature level is pre-pended with "Reference context."</li> <li>• If you modify the shared policy that is pre-pended with "Reference context," Security Manager may ask you if you want to copy the policy to other applicable contexts. (A particular device may appear in more than one context.)</li> <li>• If you choose to copy the policy to other applicable contexts, an error message informs you if some parameters cannot be copied.</li> </ul> <p><b>Note</b> Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database. As a result, you may notice the deletion of some of your unused tuning contexts.</p> |
| Signature ID                         | <p>The unique numerical value assigned to this signature. This value lets the sensor identify a particular signature.</p> <p>The value is 1000 to 65000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 38-5** *Edit Signature Parameters Dialog Box (Continued)*

| <b>Elements</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SubSignature ID   | The unique numerical value assigned to this subsignature. The subsignature ID identifies a more granular version of a broad signature. The value is 0 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Promiscuous Delta | Modifies the seriousness of an alert when operating in promiscuous mode. The value is subtracted from an alert's overall risk rating. The promiscuous delta is ignored when operating in inline mode. The value can be 0 to 30.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Sig Description   | <p>A description of the signature to help you distinguish this signature from other signatures:</p> <ul style="list-style-type: none"> <li>• Alert Notes—Additional information about this signature that will be included in the alert message.</li> <li>• User Comments—Your comments about the signature.</li> <li>• Alarm Traits—Traits you want to document about this signature. The value is 0 to 65535. The default is 0.</li> <li>• Release—The release in which the signature was most recently updated.</li> <li>• Signature Creation Date—The date on which the signature was created.</li> <li>• Signature Type—The type of signature: Anomaly, Component, Exploit, Vulnerability, or Other.</li> </ul>                                                      |
| Engine            | <p>The engine that parses and inspects the traffic specified by this signature. The engine determines which parameters are available in the Engines folder. For a description of the engines, see <a href="#">Engine Options, page 38-17</a>.</p> <p>For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the <i>Installing and Using Cisco Intrusion Prevention System Device Manager</i> document for the IPS Software release you are using.</p> <p><b>Tip</b> Many engines include the Fragment Status parameter, which lets you identify whether packet fragments should be inspected. You can elect to not inspect fragments, to inspect fragments, or to apply the signature to any packet status.</p> |

Table 38-5 Edit Signature Parameters Dialog Box (Continued)

| Elements                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event Counter                                      | <p>How the sensor counts events. For example, you can specify that you want the sensor to send an alert only if the same signature fires 5 times for the same address set. Configure the following values:</p> <ul style="list-style-type: none"> <li>Event Count—The number of times an event must occur before an alert is generated. The value is 1 to 65535. The default is 1.</li> <li>Event Count Key—The storage type used to count events for this signature. Choose attacker address, attacker address and victim port, attacker and victim addresses, attacker and victim addresses and ports, or victim address. The default is attacker address.</li> <li>Specify Alert Interval—Whether you want to specify the time between alerts for resetting the event count, Yes or No. If you select Yes, enter the time in seconds from 2 to 1000.</li> </ul>                                                                                                                                                                    |
| Alert Frequency                                    | <p>How often the sensor alerts you when this signature is firing. Specify the following parameters for this signature. These parameters are explained below.</p> <ul style="list-style-type: none"> <li>Summary Mode</li> <li>Summary Interval</li> <li>Summary Key</li> <li>Specify Global Summary Threshold</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Summary Mode<br>(Alert Frequency group)            | <p>The mode of alert summarization. There are four modes: Fire All, Fire Once, Summarize, and Global Summarize. The summary mode is changed dynamically to adapt to the current alert volume. For example, you can configure the signature to Fire All, but after a certain threshold is reached, it starts summarizing. Your selection of summary mode controls which other parameters are available in the Summary Mode group.</p> <ul style="list-style-type: none"> <li>Fire All—Fires an alert on all events.</li> <li>Fire Once—Fires an alert only once.</li> <li>Summarize—Summarizes alerts.</li> <li>Global Summarize—Summarizes an alert so that it only fires once regardless of how many attackers or victims.</li> </ul> <p><b>Note</b> When multiple contexts from an ASA device are contained in one virtual sensor, the summary alerts contain the context name of the last context that was summarized. Thus, the summary is the result of all alerts of this type from all contexts that are being summarized.</p> |
| Specify Summary Threshold<br>(Summary Mode group.) | <p>When you select Fire All, you can select whether you want to configure the summary threshold settings that will be used if the device dynamically changes to summary mode. If you select Yes, you can configure the summary interval, key, or global summary thresholds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Summary Interval<br>(Summary Mode group.)          | <p>The time in seconds used in each summary alert. The value is 1 to 65535. The default is 15.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 38-5** *Edit Signature Parameters Dialog Box (Continued)*

| Elements                                                  | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary Key<br>(Summary Mode group.)                      | The storage type used to summarize alerts. Choose Attacker address, Attacker address and victim port, Attacker and victim addresses, Attacker and victim addresses and ports, or Victim address. The default is Attacker address.                                                                                                     |
| Specify Global Summary Threshold<br>(Summary Mode group.) | Whether to specify the threshold number of events to take the alert into global summary, Yes or No. If you select Yes, enter the threshold number of events, from 1 to 65535. The default is 240.                                                                                                                                     |
| Status                                                    | The status of the signature.<br><br>The Obsoletes list shows the signatures that are obsoleted by this signature; click the pencil icon to open the list. In many cases, this information is read-only. If you can modify the list, click Set in the parameter field to open the list, where you can add the obsoleted signature IDs. |
| Vulnerable OS List                                        | The list of operating systems that this attack targets.                                                                                                                                                                                                                                                                               |
| MARS Category                                             | The category in Cisco Security MARS to which this signature belongs. This metadata is used to color the events generated in such a way as to provide MARS with the data that it needs to process this signature relative to the event categories that it studies.                                                                     |
| Expand All button                                         | Expands all categories and subcategories.                                                                                                                                                                                                                                                                                             |
| Collapse All button                                       | Collapses all fields to the category.                                                                                                                                                                                                                                                                                                 |

## Editing the Component List for Meta Engine Signatures

Use the Edit Signature Parameter—Component List dialog box to edit the component list for a meta engine signature.

The Meta engine defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets. As signature events are generated, the Meta engine inspects them to determine if they match any or several Meta definitions. The Meta engine generates a signature event after all requirements for the event are met.

All signature events are handed off to the Meta engine by the Signature Event Action Processor. The Signature Event Action Processor hands off the event after processing the minimum hits option. Summarization and event action are processed after the Meta engine has processed the component events.

The Meta engine is different from other engines in that it takes alerts as input where most engines take packets as input. Thus, in a Meta engine signature, you must identify the signatures that the Meta signature should be looking for. This list of signatures is contained in the Component list.

The Component list is part of the signature parameters. To edit the parameters, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), page 38-19. When you open the Edit Signature Parameters dialog box for a signature that uses the Meta engine, look for the **Engine > Component List** parameter. The parameter value contains a pencil icon and the word List. Click **List** to open the Edit Signature Parameter—Component List dialog box.

The dialog box is divided into two lists, an Inactive list (on the left) and an active list (on the right). The active list defines the signatures that the Meta engine signature is looking for.

To modify the components list:

- **Add new components**—Click the **Add Entry (+)** button to the left of the inactive list. The Add Signature Parameter—List Entry dialog box opens. Configure the following values:
  - **Entry Key**—A name for the component.
  - **Component Sig ID**—The signature ID of the signature you are looking for.
  - **Component SubSig ID**—The subsignature ID; enter 0 if there are no subsignatures.
  - **Component Count**—The number of times this signature must fire before the Meta signature is triggered.
  - **Is a Not Component**—This field lets you create negative entries; thus, you can identify a list where some signatures must fire, and some signatures must not fire. Select **No** for signatures that must fire, and **Yes** for signatures that must not fire.

When you click **OK** in the Add Signature Parameter—List Entry dialog box, the new component is added to the inactive list. Select it and click the **>>** button to move it to the active list. Then, use the Up and Down arrow buttons to position the component in the active component list; a third button is available to reset the order to the previously saved order.

- **Edit an existing component**—Select the component (in either list) and click the **Edit Entry (pencil)** button that is between the lists. The Edit Signature Parameter—List Entry dialog box opens. The parameters are the same as for adding a new entry, except that you cannot change the component name.
- **Delete a component**—Select the component in the inactive list and click the **Delete Entry (trash can)** button that is to the left of the inactive list. If you want to delete an active component, you must first select it in the active list and click the **<<** button to move it to the inactive list.
- **Restore defaults**—If you want to restore the default values of a component, select it and click **Restore**.

## Obsoletes Dialog Box

Use the Obsoletes dialog box to identify obsolete signatures associated with a particular signature. In many cases, this information is read-only. In some cases, it is read-write; for example, you can edit the list for IOS IPS signature policies for Local or shared-policy-specific signatures.

If you can edit the list:

- Click the **Add Entry (+)** button to add the signature and subsignature ID of a signature that is made obsolete by the signature you are editing.
- Select an entry and click the **Delete Entry (trash can)** button to remove it from the list of obsoleted signatures.

### Navigation Path

The Obsoletes list is part of the signature parameters. To edit the parameters, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), page 38-19. When you open the Edit Signature Parameters dialog box, look for the **Status > Obsoletes** parameter. The parameter value contains a pencil icon and the word Set (when the parameter is not read-only). Click the pencil or word to open the Obsoletes dialog box.

# Configuring Signature Settings

Use the Signature Settings page to define settings for IPS appliances and service modules (but not Cisco IOS IPS devices). These settings define the following policies:

- **Application policy**—Enable or disable HTTP, determine and specify the maximum number of HTTP requests, specify AIC web ports, and enable or disable FTP.
- **Fragment reassembly policy**—Configure the sensor to reassemble a datagram that has been fragmented over more than one packet by selecting the IP reassembly mode.
- **Stream reassembly policy**—Configure the sensor to monitor only TCP sessions that have been established by a complete three-way handshake by specifying whether a TCP handshake is required and by selecting the TCP reassembly mode.
- **IP logging policy**—Configure the sensor to generate an IP session log when the sensor detects an attack by determining and selecting the maximum allowable number of log packets, the IP log time and the maximum allowable size of the IP log.

## Tip

All of these settings have default values, so configure this policy only if you need to use a non-default value.

To configure the Signature Settings policy, do one of the following:

- (Device view) Select **IPS > Signatures > Settings** from the Policy selector.
- (Policy view) Select **IPS > Signatures > Settings**, then select an existing policy or create a new one.

You can then configure the options that are explained in the following table.

**Table 38-6** Signature Settings Page

| Element                | Description                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable HTTP            | Enables protection for web services. Select <b>Yes</b> to require the sensor to inspect HTTP traffic for compliance with the RFC.                                                                                                    |
| Max HTTP Requests      | The maximum number of outstanding HTTP requests per connection.                                                                                                                                                                      |
| AIC Web Ports          | The ports on which to look for AIC traffic. Enter a comma-separated list of port numbers or port list objects that define the ports. You can click <b>Select</b> to select a port list object from a list or to create a new object. |
| Enable FTP             | Enables protection for FTP services. Select <b>Yes</b> to require the sensor to inspect FTP traffic.                                                                                                                                 |
| IP Reassembly Mode     | The method the sensor uses to reassemble the fragments, based on the operating system.                                                                                                                                               |
| TCP Handshake Required | Whether the sensor should only track sessions for which the three-way handshake is completed.                                                                                                                                        |

**Table 38-6** Signature Settings Page (Continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Reassembly Mode | <p>The mode the sensor should use to reassemble TCP sessions with the following options:</p> <ul style="list-style-type: none"> <li>• Asymmetric—May only be seeing one direction of bidirectional traffic flow.</li> </ul> <p><b>Note</b> Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.</p> <ul style="list-style-type: none"> <li>• Loose—Use in environments where packets might be dropped.</li> <li>• Strict—If a packet is missed for any reason, all packets after the missed packet are not processed.</li> </ul> |
| Max IP Log Packets  | The number of packets you want logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IP Log Time         | The duration you want the sensor to log, from 1 to 60 minutes. The default is 30 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Max IP Log Bytes    | The maximum number of bytes you want logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## CHAPTER 39

# Configuring Event Action Rules

An IPS event is an IPS message that contains an alert, a block request, a status message, or an error message. An event action is the sensor's response to an event. An event action happens only if the event is not filtered. Possible event actions are TCP reset, block host, block connection, IP logging, and capturing the alert trigger packet. Event actions were known as alarms in Cisco IPS versions earlier than 5.x.

The IPS Event Actions folder is where you configure settings for the event action processing component of the sensor. These settings define the actions for the sensor to take when an event is detected.

**Note**

You cannot use IPv6 addresses in Event Action policies in Security Manager. For more information on IPv6 support in Security Manager, see [IPv6 Support in Security Manager, page 1-7](#).

This chapter contains the following topics:

- [Understanding the IPS Event Action Process, page 39-1](#)
- [Understanding IPS Event Actions, page 39-2](#)
- [Configuring Event Action Filters, page 39-4](#)
- [Configuring Event Action Overrides, page 39-13](#)
- [Configuring IPS Event Action Network Information, page 39-14](#)
- [Configuring Settings for Event Actions, page 39-21](#)

## Understanding the IPS Event Action Process

The IPS event action rules dictate the actions that the sensor performs when an event occurs. Although each signature is configured with specific actions that should be taken, the actual actions performed also depend on other factors.

Following is the general process that occurs when inspection identifies a signature event:

1. A signature alert occurs with actions specified by the signature. A risk rating for the alert is calculated.

For a detailed explanation of how risk rating is calculated, see [Calculating the Risk Rating](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

You can influence risk ratings by configuring target value ratings and OS mappings; see [Configuring IPS Event Action Network Information, page 39-14](#).

2. The **Event Action Overrides** policy is processed. If the risk rating of the event matches an override rule, the actions identified in the override rule are **added** to the actions defined in the signature. The overrides do not replace the actions specified in the signature.

For information on configuring overrides, see [Configuring Event Action Overrides, page 39-13](#).

3. The **Event Action Filters** policy is processed. If rules apply to the event, the rules **subtract** actions from the event. Thus, an action you added in a signature policy or override rule might be removed by one of your filter rules.

For information on creating filter rules, see [Configuring Event Action Filters, page 39-4](#).

4. Event summarization occurs, unless you turn off the summarization feature as described in [Configuring Settings for Event Actions, page 39-21](#).
5. The actions are performed. For an explanation of possible actions, see [Edit, Add, Replace Action Dialog Boxes, page 38-8](#).
6. A list of denied attackers is maintained, and subsequent access prevented, based on configurable settings. To change the default settings, see [Configuring Settings for Event Actions, page 39-21](#).

## Understanding IPS Event Actions

When you configure an event action filter or override, or a signature, you specify an action for events that meet the rule. For signatures and overrides, you are specifying an action to add to the event; for filters, you are specifying an action to remove from the event.

The most common action is Produce Alert, which generates an alert that you can view in your network management system, such as the Security Manager Event Viewer or CS MARS. However, there are a wide variety of actions that you can assign to an event. When looking over the possible actions, keep the following in mind:

- Many actions produce alerts in addition to the other action performed. The description for each action explains whether an alert is also produced.
- Cisco IOS IPS supports fewer actions for event action override or filter rules. The actions supported are Deny Attacker Inline, Deny Connection Inline, Deny Packet Inline, Product Alert, and Reset TCP Connection.
- Not all actions are necessarily available on all combinations of IPS software version and device type. Whenever you need to select an action, only those actions that are valid are available for selection.
- For deny and block actions, use the event actions settings policy to set the period of time for which addresses or packets are denied. For more information, see [Configuring Settings for Event Actions, page 39-21](#).

The following table explains the possible actions.

**Table 39-1** IPS Event Actions

| Menu Command                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny Attacker Inline              | <p>Terminates the current packet and future packets from this attacker address for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p> <p>For Cisco IOS IPS devices, no connection can be established from the attacker to the router until the shun time expires.</p> <p><b>Tip</b> This is the most severe of the deny actions. It denies current and future packets from a single attacker address. For IPS appliances and service modules, you can use the IPS Device Manager to see a list of denied attackers and clear the list if necessary.</p> |
| Deny Attacker/Service Pair Inline | <p>Does not transmit this packet and future packets on the attacker address victim port pair for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |
| Deny Attacker/Victim Pair Inline  | <p>Does not transmit this packet and future packets on the attacker/victim address pair for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| Deny Connection Inline            | <p>Terminates the current packet and future packets on this TCP flow. Other connections from the attacker can be established.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| Deny Packet Inline                | <p>Terminates the packet.</p> <p>The IPS must be operating in inline mode.</p> <p>For Cisco IOS IPS devices, this action discards the packet without sending a reset. Cisco recommends using “drop and reset” in conjunction with alarm.</p> <p><b>Tip</b> For IPS appliances and service modules, there is an event action override that adds this action to high risk events. You cannot delete the override. If you do not want to use it, disable the override. For more information, see <a href="#">Configuring Event Action Overrides</a>, page 39-13.</p>                     |
| Log Attacker Packets              | <p>Starts IP logging on packets that contain the attacker address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| Log Pair Packets                  | <p>Starts IP Logging on packets that contain the attacker/victim address pair. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                               |
| Log Victim Packets                | <p>Starts IP Logging on packets that contain the victim address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| Modify Packet Inline              | <p>Modifies packet data to remove ambiguity about what the endpoint might do with the packet.</p> <p><b>Tip</b> This option is not available for event action override or filter rules. It is available in signatures.</p>                                                                                                                                                                                                                                                                                                                                                            |

Table 39-1 IPS Event Actions (Continued)

| Menu Command             | Description                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Alert            | Writes the event to the Event Store as an alert. For Cisco IOS IPS devices, the notification is sent through syslog or SDEE.<br><b>Note</b> A Produce Alert event action is added for an event when global correlation has increased the risk rating of an event, and has added either the Deny Packet Inline or Deny Attacker Inline event action. |
| Produce Verbose Alert    | Includes an encoded dump of the offending packet in the alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.                                                                                                                                                                                 |
| Request Block Connection | Sends a request to block this connection. You must have blocking devices configured to implement this action. For more information, see <a href="#">Configuring IPS Blocking and Rate Limiting, page 42-7</a> .                                                                                                                                     |
| Request Block Host       | Sends a request to block this attacker host. You must have blocking devices configured to implement this action.                                                                                                                                                                                                                                    |
| Request Rate Limit       | Sends a rate limit request to perform rate limiting. You must have rate limiting devices configured to implement this action.                                                                                                                                                                                                                       |
| Request SNMP Trap        | Requests that the sensor send an SNMP trap notification to the configured trap destinations. This action causes an alert to be written even if Produce Alert is not selected. You must have SNMP configured on the sensor for traps to actually be sent. For more information, see <a href="#">Configuring SNMP, page 35-8</a> .                    |
| Reset TCP Connection     | Sends TCP resets to hijack and terminate the TCP flow, sending a reset to both the source and destination addresses. Reset TCP Connection works only on TCP signatures that analyze a single connection, for example, half-open SYN attacks. It does not work for sweeps or floods.                                                                 |

## Configuring Event Action Filters

You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor.

Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes all actions from an event effectively consumes the event. Before configuring filter rules, read [Tips for Managing Event Action Filter Rules, page 39-6](#).

**Note**

When filtering sweep signatures, we recommend that you do not filter the destination addresses. If there are multiple destination addresses, only the last address is used for matching the filter.

### Related Topics

- [Understanding the IPS Event Action Process, page 39-1](#)

**Step 1** Do one of the following to open the Event Action Filters policy:

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

The table shows the existing filter rules organized into sections. The Local section is for rules defined specifically for a selected device (in Device view). For shared or inherited policies, there are also sections for mandatory and default rules. For more information about the contents of this policy, see [Event Action Filters Page, page 39-7](#).

**Step 2** Select the row after which you want to create the filter rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add Filter Item dialog box. For detailed information about the options in this dialog box, see [Filter Item Dialog Box, page 39-9](#).

### Tips

- If you do not select a row, the new rule is added at the end of the local scope.
- You can also select an existing row and edit either the entire row (by clicking the **Edit Row** button) or specific cells. To edit a specific cell, right-click the cell and select the **Edit** command related to the cell from the top of the context menu.
- You can delete a rule by selecting it and clicking the **Delete Row** button.
- You can export the entire list of filter rules to a comma-separated values (CSV) file. Click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

**Step 3** Configure the filter rule. Following are the highlights of what you typically need to configure. For specific information on configuring the fields, and for information on fields not mentioned here, see [Filter Item Dialog Box, page 39-9](#).

- Name—You must enter a name for the rule. Use a name that is meaningful to you.
- Signature, Subsignature ID—If the filter should apply to all signatures, use the default values. If you are targeting a specific signature, enter its signature and subsignature identifiers. You can obtain these values by finding the signature in the Signatures policy (see [Signatures Page, page 38-4](#)).
- Attacker and Victim Addresses and Ports—If the filter should apply no matter who is attacking, or who is the victim, use the default values. If you are creating a filter specific to an attacker or victim, update these fields to match the appropriate address and port.
- Risk Rating—You are most likely to want to change this value. The filter is applied to events that are within the minimum-maximum range you configure here. The default value, 0-100, will apply the filter rule to all events. If you configure a specific signature ID, the rating applies only to events for that signature (in which case the default risk rating might be acceptable).

For example, you might want to target only high-risk events, such as 90-100.

- Actions to Subtract—Select the actions that you want to subtract from the event. Use Ctrl+click to select more than one action. If you select an action that is not actually assigned to an event, the filter rule essentially has no effect on the event. For more information about the actions, see [Edit, Add, Replace Action Dialog Boxes, page 38-8](#).

- **Stop on Match**—Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:
  - If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.
  - If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.

Click **OK** when you are finished defining your filter rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Ensure that stop rules are placed after other rules that you want applied prior to the stop.
- 

## Tips for Managing Event Action Filter Rules

Following are some tips that might help you effectively manage your event action filter rules:

- Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

Disabling a rule is useful if you want to stop using the rule, but you might want to start using it again in the future. Disabled rules remain in the table so that you do not need to recreate them.

- For existing rules, you can edit most of the fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate Edit command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**.

Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. Other commands simply change a value, or open a sub-menu from which you can select a value to add or remove. For example, right-clicking the Action cell provides four commands:

- **Add to Actions**—Select from a list of actions to add to those already defined in the rule.
  - **Delete from Actions**—Select from a list of actions defined in the rule to remove from the rule.
  - **Replace Actions With**—Select from a list the action that you want to completely replace those defined in the rule.
  - **Edit Actions**—Opens a dialog box where you can select all actions for the rule. Your selection replaces the cell contents.
- Although filter rules are configured as an ordered list, the rules are not processed as a “first match wins” list, even through they are processed and applied top to bottom. Instead, each rule has a Stop property: the rule is either a stop rule or it is not a stop rule. Processing ends only if an event matches a stop rule. If an event matches a non-stop rule, the event is compared to subsequent filter rules. Thus, more than one filter rule can apply to an event. If you decide to create stop rules, ensure that you place them below all other rules that you want processed for an event.

If you define no stop rules, each event is compared to all filter rules, and all matching rules are applied to the event in top-to-bottom order.

- You can inherit event action filter rules policies. Thus, you could configure a shared policy in Policy view that includes filter rules that you want to share among all of your devices, inherit that rule for each device (in Device view), and in Device view configure local filter rules that are unique to each device. For more information on inheriting policies, see:
  - [Creating a New Shared Policy, page 5-51](#)
  - [Inheritance vs. Assignment, page 5-6](#)
  - [Inheriting or Uninheriting Rules, page 5-43](#)

## Event Action Filters Page

Use the Event Actions Filters page to configure event action filter rules. Filter rules can remove specific actions from an event or they can discard an entire event and prevent further processing by the sensor.

Event action filters are processed as an ordered list and you can move filters up or down in the list. Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes all actions from an event effectively consumes the event.

Before configuring event action filter rules, read the following topics:

- [Configuring Event Action Filters, page 39-4](#)
- [Tips for Managing Event Action Filter Rules, page 39-6](#)
- [Understanding the IPS Event Action Process, page 39-1](#)

Tip

Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

#### Navigation Path

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

#### Field Reference

**Table 39-2** *Event Action Filters Page*

| Element | Description                                                                                |
|---------|--------------------------------------------------------------------------------------------|
| Name    | The name of the filter rule.                                                               |
| Active  | Whether the signature is active.<br>This cell is not available for Cisco IOS IPS policies. |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDs                   | The signature identifiers to which this rule applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Subs                  | The subsignature identifiers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Attackers             | <p>The IP address of the attacker that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object.</p> <p><b>Tip</b> If you use a network/host object, you can see the contents of the object by right-clicking it and selecting <b>Show Contents</b>.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> |
| Attack Ports          | The port used by the attacker host that triggers the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Victims               | <p>The IP address of the victim that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object.</p> <p><b>Tip</b> If you use a network/host object, you can see the contents of the object by right-clicking it and selecting <b>Show Contents</b>.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p>   |
| Victim Ports          | The port targeted by the attacker host that triggers the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Actions               | The actions that should be removed from the event when the filter is triggered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| RR                    | <p>The risk rating range that triggers this event action filter.</p> <p>For a detailed explanation of how risk rating is calculated, see <a href="#">Calculating the Risk Rating</a> in <i>Installing and Using Cisco Intrusion Prevention System Device Manager 7.0</i> on Cisco.com.</p>                                                                                                                                                                                                                                                                     |
| Stop                  | Whether this is a stop rule. If Yes, then when an event meets the conditions of this rule, the filter is applied to the event but the event is not tested against the remaining rules in the event action filter rules policy.                                                                                                                                                                                                                                                                                                                                 |
| Export to File button | Click this button to export the event action filters summary to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.                                                                                                                                                                                                                                                                                                                                                          |

**Table 39-2** Event Action Filters Page (Continued)

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Up Row and Down Row buttons (arrow icons) | <p>Click these buttons to move the selected rules up or down within a scope.</p> <p>Filter rules are processed in order top to bottom for each event. If the conditions of an event match those defined for a filter, and the filter has the Stop field set to Yes, that filter is applied and no additional filters are considered. Ensure that stop rules are placed after the other rules you want applied to an event.</p> <p>You should order the more restrictive rules before general rules in the table.</p> |
| Add Row button                            | Click this button to add a filter rule to the table after the selected row using the Add Filter Item dialog box (see <a href="#">Filter Item Dialog Box, page 39-9</a> ). If you do not select a row, the rule is added at the end of the local scope.                                                                                                                                                                                                                                                               |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells by right-clicking the cell and selecting the appropriate Edit command.                                                                                                                                                                                                                                                                                                                                                               |
| Delete Row button                         | <p>Click this button to delete the selected rule.</p> <p><b>Tip</b> Instead of removing the rule, you can right-click the rule and select <b>Disable</b>. This prevents the rule from being used, but leaves it in the table in case you want to use it again at a later time.</p>                                                                                                                                                                                                                                   |

## Filter Item Dialog Box

Use the Add or Edit Filter Item dialog box to configure an event action filter rule.

**Tip**

For existing rules, you can edit most of these fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**. Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. When seeking help for these context-editing dialog boxes, look for the property description in the table below.

### Navigation Path

From the Event Action Filters page (see [Event Action Filters Page, page 39-7](#)), click the **Add Row** button, or select a filter rule and click the **Edit Row** button.

|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active<br>Enabled<br><br>(Active does not apply to Cisco IOS IPS devices.) | <p>Whether the filter rule is active and enabled. Active means that the filter has been put into the filter list and will take effect on filtering events. The default is that the rule is both active and enabled, which means that the rule is used when events are processed.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If a filter is active but not enabled, it will still be included in the ordering list; it will be processed, but it will not be used.</li> <li>• If a filter is not active, then it will not be included at all in the ordering of the filters; it will not be processed at all.</li> <li>• Disabled rules are shown in the event action filters table with cross-hatching.</li> </ul> |
| Name                                                                       | <p>The name of the filter rule. The following characters are allowed in filter names:</p> <p>a-z, A-Z, 0-9, -, . (dot or period), : (colon), and _ (underscore).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Signature IDs                                                              | <p>The numerical signature IDs to which the filter rule applies. You can enter a single signature ID, a comma-separated list, or a range of IDs. The default is to apply the rule to signatures in the range 900-65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SubSignature ID                                                            | <p>The subsignature ID for the specified signature to which the filter rule applies. The subsignature ID identifies a more granular version of a broad signature, but it is not used for all signatures.</p> <p>Enter a subsignature ID appropriate for the signature ID you specified, or enter a range of subsignature IDs. The default value is the range of 0-255.</p>                                                                                                                                                                                                                                                                                                                                                              |
| Attacker IPv4 Address                                                      | <p>The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).</p>                                                                                                                                                                                                |
| Attacker IPv6 Address                                                      | <p>The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).</p>                                                                                                                                                                            |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attacker Port             | <p>The port used by the attacker host. This is the port from which the offending packet originated. You can also enter a range of ports.</p> <p>The default value is a range of all ports (0-65535).</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Victim IPv4 Address       | <p>The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).</p>                     |
| Victim IPv6 Address       | <p>The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).</p> |
| Victim Port               | <p>The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent. You can also enter a range of ports.</p> <p>The default value is a range of all ports (0-65535).</p>                                                                                                                                                                                                                                                                                                                                        |
| Risk Rating Min. and Max. | <p>The risk rating range, between 0 and 100, that should be used to trigger this event action filter. The default value is the complete range (0-100).</p> <p>If an event occurs with a risk rating that falls within the minimum-maximum range you configure here, the event is processed against the rules of this event filter.</p>                                                                                                                                                                                                                                               |
| OS Relevance              | <p>Indicates whether the alert is relevant to the OS that has been identified for the victim. Possible values include one or more of the following: Not Relevant, Relevant, Unknown. Use Ctrl+click to select multiple values. The default is all values selected.</p> <p><b>Note</b> OS Relevance is applicable only to appliances and service modules running IPS 6.x+ software. For Cisco IOS IPS devices, this field is read-only and cannot be edited, and for IPS 5.x devices, this field is blank.</p>                                                                        |
| Comments                  | <p>The user comments associated with this filter, such as an explanation of the purpose of the rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 39-3 Filter Item Dialog Box (Continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Actions to Subtract | <p>The actions that should be removed from the event, should the conditions of the event meet the criteria of the event action filter. You can select one or more actions in this list box. All selected actions are removed from the event. Use Ctrl+click to select multiple values. For more information about the possible actions, see <a href="#">Edit, Add, Replace Action Dialog Boxes</a>, page 38-8.</p> <p>For IOS IPS devices, the possible values are restricted to the following:</p> <ul style="list-style-type: none"> <li>• <i>Deny Attacker Inline</i> blocks the attacker's source IP address completely. No connection can be established from the attacker to the router until the shun time expires. You can configure this time in the Event Actions Settings policy as described in <a href="#">Configuring Settings for Event Actions</a>, page 39-21.</li> <li>• <i>Deny Connection Inline</i> blocks the appropriate TCP flow from the attacker. Other connections from the attacker can be established to the router.</li> <li>• <i>Deny Packet Inline</i> discards the packet without sending a reset. Cisco recommends using "drop and reset" in conjunction with alarm.</li> <li>• <i>Produce Alert</i> sends a notification about the attack through syslog or SDEE.</li> <li>• <i>Reset TCP Connection</i> is effective for TCP-based connections and sends a reset to both the source and destination addresses. For example, in case of a half-open SYN attack, Cisco IOS IPS can reset the TCP connections.</li> </ul> |
| % to Deny           | <p>The percentage of packets to deny for deny attacker features. The range is 0 to 100. The default is 100 percent.</p> <p><b>Note</b> For IOS IPS devices, this field is read only and cannot be edited.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Stop on Match       | <p>Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:</p> <ul style="list-style-type: none"> <li>• If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.</li> <li>• If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Configuring Event Action Overrides

You can add an event action override to change the actions associated with an event based on the risk rating of that event. Event action overrides are a way to add event actions globally without having to configure each signature individually.

Each event action has an associated risk rating range. If a signature event occurs and the risk rating for that event falls within the range for an event action, that action is added to the event. For example, if you want any event with a risk rating of 85 or more to generate an SNMP trap, you can create an event action override for Request SNMP Trap with the risk rating 85-100.

**Tip**

If you want to prevent the use of action overrides, you can disable the entire event action override component as described in [Configuring Settings for Event Actions, page 39-21](#).

## Related Topics

- [Understanding the IPS Event Action Process, page 39-1](#)

**Step 1** Do one of the following to open the Event Action Overrides policy:

- (Device view) Select **IPS > Event Actions > Event Action Overrides** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.

The table shows the existing overrides, including the action, the risk rating of the alerts the action will be added to, and whether the rule is enabled. The order of the rules does not matter: all overrides that apply to an alert add the associated actions.

The table can have at most a single entry for each possible action.

**Step 2** Configure the desired overrides:

- To add a new override, click the **Add Row (+)** button beneath the table and fill in the Add Event Action Override dialog box. In the dialog box, select the action you want to add, enter the rating range of the alerts to which you are adding the action (for example, 90-100), and click **OK**. For more information, see [Event Action Override Dialog Box, page 39-14](#).

The risk rating range must be between 0 and 100. Separate the low and high of the range with a hyphen, for example, 80-90.

- To edit an override, to disable it or to change the risk rating, select the override and click the **Edit Row (pencil)** button. You cannot change the event action.
- To remove an override, select it and click the **Delete Row** button.

**Note**

Policies for IPS appliances and service modules include a default override for Deny Packet Inline, which you cannot delete. If you do not want to use that override, disable it.

- To export the entire list of overrides to a comma-separated values (CSV) file, click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

## Event Action Override Dialog Box

Use the Add or Edit Event Action Override dialog box to configure an event action override that acts globally (rather than per signature) to add actions associated with an event based on the risk rating of that event.

### Navigation Path

From the Event Action Overrides policy, click the **Add Row** button beneath the overrides table, or select a row in the table and click the **Edit Row** button. For information on opening the Event Action Overrides policy, see [Configuring Event Action Overrides](#), page 39-13.

### Field Reference

**Table 39-4** Event Action Override Dialog Box

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Risk Rating  | <p>The risk rating range between 0 and 100 that should be used to trigger this event action override. Separate the low and high values with a hyphen, for example, 90-100.</p> <p>If an event occurs with a risk rating that falls within the minimum-maximum range, the event action is added to the event.</p>                                                                                                                                 |

## Configuring IPS Event Action Network Information

Use the Event Actions Network Information policy to configure these features:

- Target value ratings (IPv4 Target Value Ratings tab and IPv6 Target Value Ratings tab)**—You can configure the target value ratings of your network assets. The sensor uses these ratings when calculating the overall risk rating of an alert. By identifying your mission-critical assets, you can trigger more severe signature event actions. As the names indicate, you can use IPv4 or IPv6 by selecting the appropriate tab.

Target value rating is available on IPS appliances, service modules, and Cisco IOS IPS devices.

For more information, see [Configuring Target Value Ratings](#), page 39-15.

- **Passive OS fingerprinting and OS mappings (OS Identification tab)**—You can enable the sensor to use information about the operating system running on a device to determine the attack relevance rating, which is a component of the overall risk rating.

Passive OS fingerprinting and OS mappings are available on devices running IPS 6.x+ software only, and are not available on Cisco IOS IPS devices.

For more information, see:

- [Understanding Passive OS Fingerprinting, page 39-17](#)
- [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\), page 39-18](#)

To open the Network Information policy, do one of the following:

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Network Information**, then select an existing policy or create a new one.

## Configuring Target Value Ratings

You can assign target value ratings to your network assets. The target value rating is one of the factors used to calculate the risk rating value for each alert. It identifies the perceived importance of a network asset, which you identify by its IP address.

You can develop a security policy that is more stringent for valuable corporate resources and looser for less important resources. For example, you could assign a target value rating to the company web server that is higher than the target value rating you assign to a desktop node. In this example, attacks against the company web server have a higher risk rating than attacks against the desktop node. Events with a higher risk rating trigger more severe signature event actions.

You can configure four value ratings. From highest value to lowest: Mission Critical, High, Medium, Low, No Value (zero value).

For a detailed explanation of how risk rating is calculated, see [Calculating the Risk Rating](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

### Tip

If you are configuring target value ratings on a device that uses IPS 6.0 software lower than 6.0(5), you might also want to update the OS Identification tab of the Network Information policy to get around a software bug, even if you do not need to create OS maps. For detailed information, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\), page 39-18](#).

### Related Topics

- [Configuring IPS Event Action Network Information, page 39-14](#)
- [Understanding the IPS Event Action Process, page 39-1](#)

**Step 1** Do one of the following to open the Network Information policy:

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector, then click the **IPv4 Target Value Ratings** tab or the **IPv6 Target Value Ratings** tab.

- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **IPv4 Target Value Ratings** tab or the **IPv6 Target Value Ratings** tab.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **IPv4 Target Value Ratings** tab.

---

**Note** Cisco IOS IPS devices do not support IPv6.

---

The tab shows the target value ratings that are already configured, showing the IP addresses associated with each configured ratings category. The table can have at most five entries, one per rating category.

**Step 2** Configure the desired target value ratings categories:

- To add a new ratings category, click the **Add Row (+)** button beneath the table and fill in the Add Target Value Rating dialog box. In the dialog box, select the rating you want to add, enter the host, network, and address ranges to associate with the category, and click **OK**. For more information, see [Target Value Rating Dialog Box, page 39-16](#).

For IPv4 addresses, you can specify a single network/host object, or a comma-separated list of host, network, or address ranges, such as 10.10.10.10, 10.10.10.0/24, or 10.10.10.2-10.10.10.254. Addresses that you enter in the network format are converted to address ranges. For IPv6 addresses, use IPv6 addressing conventions.

- To edit the IP addresses in an existing ratings category, select the category and click the **Edit Row (pencil)** button. You cannot change the value rating.
  - To remove a rating, select it and click the **Delete Row** button.
- 

## Target Value Rating Dialog Box

Use the Add or Edit Target Value Rating dialog box to associate the IP addresses of your assets to a ratings category. IP addresses are IPv4 when you open the Target Value Rating dialog box from the IPv4 Target Value Ratings tab; they are IPv6 from the IPv6 tab.

### Navigation Path

From the IPv4 Target Value Rating tab or the IPv6 Target Value Rating tab of the IPS Event Actions Network Information policy, click the **Add Row** button beneath the Target Value Ratings table, or select a row in the table and click the **Edit Row** button. For information on opening the IPv4 Target Value Rating tab or the IPv6 Target Value Rating tab, see [Configuring Target Value Ratings, page 39-15](#).

**Field Reference****Table 39-5 Target Value Rating Dialog Box**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value          | <p>The target value rating to associate with the specified addresses. From highest to lowest importance: Mission Critical, High, Medium, Low, No Value.</p> <p>This list includes only those value ratings that you have not already configured in the target value ratings table.</p> <p>You change this option when editing a ratings category.</p>                                                                                                                                                                                                                                                                                                                                                                |
| target-address | <p>The IP addresses of the network assets assigned to this value rating. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, using IPv4, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254. Addresses that you enter in the network format are converted to address ranges; for example, 10.10.10.0/24 is converted to 10.10.10.0-10.10.10.255.</li> </ul> |

## Understanding Passive OS Fingerprinting

Passive operating system (OS) fingerprinting is enabled by default on IPS 6.0+ sensors and the IPS contains a default vulnerable OS list for each signature.

Passive OS fingerprinting lets the sensor determine the OS that hosts are running. The sensor analyzes network traffic between hosts and stores the OS of these hosts with their IP addresses. The sensor inspects TCP SYN and SYNACK packets exchanged on the network to determine the OS type.

The sensor then uses the OS of the target host OS to determine the relevance of the attack to the victim by computing the attack relevance rating component of the risk rating. Based on the relevance of the attack, the sensor may alter the risk rating of the alert for the attack or the sensor may filter the alert for the attack. You can then use the risk rating to reduce the number of false positive alerts (a benefit in IDS mode) or definitively drop suspicious packets (a benefit in IPS mode). Passive OS fingerprinting also enhances the alert output by reporting the victim OS, the source of the OS identification, and the relevance to the victim OS in the alert.

Passive OS fingerprinting consists of three components:

- Passive OS learning.

Passive OS learning occurs as the sensor observes traffic on the network. Based on the characteristics of TCP SYN and SYNACK packets, the sensor makes a determination of the OS running on the host of the source IP address.

- User-configurable OS identification.

You can configure OS host mappings, which take precedence over learned OS mappings.

- Computation of attack relevance rating and risk rating.

The sensor uses OS information to determine the relevance of the attack signature to the targeted host. The attack relevance is the attack relevance rating component of the risk rating value for the attack alert.

There are three sources of OS information. The sensor ranks the sources of OS information in the following order:

1. Configured OS mappings—OS mappings that you enter on the OS Identification tab of the Event Actions Network Information policy. You can configure different mappings for each virtual sensor. For more information, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), page 39-18.

We recommend configuring OS mappings to define the identity of the OS running on critical systems. It is best to configure OS mappings when the OS and IP address of the critical systems are unlikely to change.

2. Imported OS mappings—OS mappings imported from Management Center for Cisco Security Agents (CSA MC).

Imported OS mappings are global and apply to all virtual sensors. For information on configuring the sensor to use CSA MC, see [Configuring the External Product Interface](#), page 35-23.

3. Learned OS mappings—OS mappings observed by the sensor through the fingerprinting of TCP packets with the SYN control bit set.

Learned OS mappings are local to the virtual sensor that sees the traffic.

When the sensor needs to determine the OS for a target IP address, it consults the configured OS mappings. If the target IP address is not in the configured OS mappings, the sensor looks in the imported OS mappings. If the target IP address is not in the imported OS mappings, the sensor looks in the learned OS mappings. If it cannot find it there, the sensor treats the OS of the target IP address as unknown.

**Tip**

You can configure Event Action Filter rules to use the OS relevancy value of the target, and configure signatures to identify the OSes vulnerable to a signature.

## Configuring OS Identification (Cisco IPS 6.x and Later Sensors Only)

Use the OS Identification tab on the Event Actions Network Information policy to configure operating system (OS) host mappings, which take precedence over learned OS mappings. On the OS Identifications tab you can add, edit, and delete configured OS maps. You can move them up and down in the list to change the order in which the sensor computes the attack relevance rating and risk rating for that particular IP address and OS type combination.

**Note**

OS Identification applies to IPS 6.0+ sensors only and does not apply to Cisco IOS IPS devices.

You can also move them up and down in the list to change the order in which the sensor resolves the OS associated with a particular IP address. Configured OS mappings allow for ranges, so for network 192.168.1.0/24 you might define the following:

| IP Address Range Set                  | OS      |
|---------------------------------------|---------|
| 192.168.1.1                           | IOS     |
| 192.168.1.2-192.168.1.10,192.168.1.25 | UNIX    |
| 192.168.1.1-192.168.1.255             | Windows |

More specific mappings should be at the beginning of the list. Overlap in the IP address range sets is allowed, but the entry closest to the beginning of the list takes precedence.

**Tip**

There is a bug in IPS 6.0 versions lower than 6.0(5) related to the Network Information policy. Even if you change nothing on the OS Identification tab, but you make configuration changes to the Threat Value Ratings tab, Security Manager configures the device to use the **any** variable for restricting OS mappings to addresses. This can result in your monitoring application showing “any” as the event locality for all events. The solution is to upgrade the IPS version on your sensor. The workaround is to enter a non-default value in the **Restrict to these IP Addresses** field on the OS Identification tab, even if you are not configuring specific OS mappings. For example, enter 0.0.0.1-255.255.255.255 instead of “any” or 0.0.0.0-255.255.255.255.

**Navigation Path**

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector, then click the **OS Identification** tab.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **OS Identification** tab.

**Field Reference****Table 39-6 OS Identification Tab**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Passive OS Fingerprinting | <p>When selected, lets the sensor perform passive OS analysis. You must enable this option for any of the maps configured on this page to be used.</p> <p>Passive OS fingerprinting functions as part of the sensor. As the sensor analyzes network traffic between hosts, the sensor stores the identity of the OS running on the hosts alongside the IP addresses of the hosts. The sensor determines the identity of the OSes on the hosts by inspecting characteristics of the packets exchanged on the network. The sensor then uses the target system’s OS information to compute the ARR (Attack Relevance Rating) component for the RR (Risk Rating). The RR can then be used to drop suspicious packets.</p> <p>For more information about passive OS fingerprinting, see <a href="#">Understanding Passive OS Fingerprinting, page 39-17</a>.</p> |
| Restricted to these IP Addresses | <p>Restricts attack relevance rating calculation to the specified addresses. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254.</li> </ul>                                                                                                                                                                                                                                                                                                    |

**Table 39-6 OS Identification Tab (Continued)**

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OS Maps table | <p>The list of OS mappings, showing the IP addresses of the hosts and the operating systems to which they are mapped. When looking for a match, the sensor goes from top to bottom and selects the first rule that matches the IP address.</p> <ul style="list-style-type: none"> <li>To add a mapping, click the <b>Add Row</b> button and fill in the Add OS Map dialog box (see <a href="#">OS Map Dialog Box, page 39-20</a>).</li> <li>To edit a mapping, select the rule and click the <b>Edit Row</b> button.</li> <li>To delete a map, select it and click the <b>Delete Row</b> button.</li> <li>To change the priority of a rule, select it and click the <b>Up</b> or <b>Down</b> arrow buttons until the rule is positioned correctly.</li> </ul> |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## OS Map Dialog Box

Use the Add or Edit OS Map dialog box to map a host through its IP address to an OS type. Create mappings only if you want to statically assign an OS type to an IP address. Because the sensor uses passive OS fingerprinting to discover the OS associated with an IP address, you might not want to create any mappings, or create mappings only for mission-critical devices that have static IP addresses. Update any mappings that you create if you install devices with different operating systems on the address.

### Navigation Path

From the OS Identification tab of the IPS Event Actions Network Information policy, click the **Add Row** button beneath the OS Maps table, or select a row in the table and click the **Edit Row** button. For information on opening the OS Identification tab, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), page 39-18.

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Addresses | <p>The IP addresses for this mapping. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>A comma-separated list of host or network addresses or address ranges. For example, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254.</li> </ul> |

**Table 39-7 OS Map Dialog Box (Continued)**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OS Type | <p>The operating system running on the identified hosts. Select the most appropriate option from the list. You can select multiple options (using Ctrl+click) to indicate that there is more than one possible OS.</p> <p><b>Tip</b> Because these mappings take precedence over learned mappings, you probably are better off not assigning General OS, Other, or Unknown OS. The sensor might be able to learn the actual OS through passive OS fingerprinting and provide a better matching. For more information, see <a href="#">Understanding Passive OS Fingerprinting, page 39-17</a>.</p> |

## Configuring Settings for Event Actions

Use the Event Actions Settings policy to configure general settings that apply globally to event action rules. The defaults for these options are appropriate for most situations, so change them only if you are certain that your situation requires non-default behavior.

To configure the Event Actions Settings policy, do one of the following:

- (Device view) Select **IPS > Event Actions > Settings** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Settings**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Settings**, then select an existing policy or create a new one.

The following table describes the options you can configure. Note that the options available for Cisco IOS IPS devices are more limited than those available for IPS appliances and service modules.

**Tip**

Do not disable the Summarizer or Meta Event Generator except for troubleshooting purposes. If you disable the Summarizer, every signature is set to Fire All with no summarization. If you disable the Meta Event Generator, all Meta engine signatures are disabled.

**Table 39-8 Event Actions Settings Policy**

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Event Action Override<br>(All device types.) | When selected, enables override rules as defined on the Event Action Overrides page. You can add an event action override to add actions to an event based on specific details about that event. For configuring override rules, see <a href="#">Configuring Event Action Overrides, page 39-13</a> .                                                          |
| Enable Event Action Filters<br>(All device types.)  | When selected, enables the filter rules as defined on the Event Action Filters page. You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor. For configuring event action filters rules, see <a href="#">Configuring Event Action Filters, page 39-4</a> . |

Table 39-8 Event Actions Settings Policy (Continued)

| Element                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Event Action Summarizer<br>(IPS appliances and service modules only.)   | <p>When selected, enables the Summarizer component. The Summarizer groups events into a single alert, thus decreasing the number of alerts the sensor sends out.</p> <p>By default, the Summarizer is enabled. If you disable it, all signatures are set to Fire All with no summarization. If you configure individual signatures to summarize, this configuration is ignored when the Summarizer is not enabled.</p> <p>The Report Manager component of Cisco Security Manager reports events individually. The Event Viewer component of Cisco Security Manager displays alerts. As stated above, the Summarizer groups events into a single alert, thus decreasing the number of alerts the sensor sends out.</p> <p><b>Tip</b> Cisco IPS Manager Express (IME) and Cisco Security Manager do not summarize events in precisely the same way.</p>                                                     |
| Enable Meta Event Generator<br>(IPS appliances and service modules only.)      | <p>When selected, enables the Meta Event Generator. The Meta Event Generator processes the component events, which lets the sensor watch for suspicious activity transpiring over a series of events.</p> <p>By default, the Meta Event Generator is enabled. If you disable the Meta Event Generator, all Meta engine signatures are disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Threat Rating Adjustment<br>(IPS appliances and service modules only.)  | <p>When selected, enables threat rating adjustment, which adjusts the risk rating. If disabled, risk rating is equal to threat rating. Available in sensors running IPS 6.0+ software only.</p> <p>The Threat Rating feature provides a single view of the threat environment of the network. Threat Rating minimizes alarms and events through a customized view that shows only events with a high Threat Rating value. The Threat Rating value is derived as follows:</p> <ul style="list-style-type: none"> <li>• Dynamic adjustment of event Risk Rating based on success of response action</li> <li>• If response action was applied, Risk Rating is deprecated (Threat Rating &lt; Risk Rating)</li> <li>• If response action was not applied, Risk Rating remains unchanged (Threat Rating = Risk Rating)</li> </ul> <p>The result is a single value by which the threat risk is determined.</p> |
| Deny Attacker Duration in seconds<br>(All device types.)                       | <p>The number of seconds to deny the attacker inline.</p> <p>The range is 0 to 518400. The default is 3600.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Block Attack Duration in minutes<br>(IPS appliances and service modules only.) | <p>The number of minutes to block a host or connection.</p> <p>The range is 0 to 10000000. The default is 30.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Enable One Way TCP Reset<br>(IPS appliances and service modules only.)           | When selected, enables a one-way TCP reset for deny packet inline actions for TCP-based alerts. Available only for sensors running IPS 6.1+ software.<br><br>The one-way TCP reset operates for inline mode only and is an automatic addition to the deny packet inline actions. It sends a TCP reset to the victim of the alert, thus creating a black hole for the attacker and clearing the TCP resources of the victim.<br><br><b>Tips</b> <ul style="list-style-type: none"> <li>• In inline mode, all packets entering or leaving the network must pass through the sensor.</li> <li>• An inline sensor denies packets for any alert with a risk rating of greater than or equal to 90. It also issues a one-way TCP reset on TCP alerts with a risk rating of greater than or equal to 90.</li> </ul> |

# CHAPTER 40

## Managing IPS Anomaly Detection

---

Anomaly detection is designed to recognize network congestion caused by worm traffic that exhibits scanning behavior. Anomaly detection also will identify infected hosts on the network that are scanning for other vulnerable hosts.

Anomaly detection is enabled by default, but there are some configuration settings you should adjust to use it effectively.

### Note

---

The sensor must use IPS software version 6.x or higher to configure anomaly detection. In addition, Cisco IOS IPS and the AIP-SSC-5 do not support anomaly detection.

---

This chapter contains the following topics:

- [Understanding Anomaly Detection, page 40-1](#)
- [Configuring Anomaly Detection, page 40-6](#)

## Understanding Anomaly Detection

The anomaly detection component of the sensor detects worm-infected hosts. This enables the sensor to be less dependent on signature updates for protection against worms and scanners, such as Code Red and SQL Slammer and so forth. The anomaly detection component lets the sensor learn normal activity and send alerts or take dynamic response actions for behavior that deviates from what it has learned as normal behavior.

### Note

---

Anomaly detection does not detect email-based worms, such as Nimda.

---

Anomaly detection detects the following two situations:

- When the network starts on the path of becoming congested by worm traffic.
- When a single worm-infected source enters the network and starts scanning for other vulnerable hosts.

The following topics explain anomaly detection in more detail:

- [Worm Viruses, page 40-2](#)
- [Anomaly Detection Modes, page 40-2](#)
- [Anomaly Detection Zones, page 40-3](#)

- [Knowing When to Turn Off Anomaly Detection, page 40-4](#)
- [Configuring Anomaly Detection Signatures, page 40-4](#)
- [Configuring Anomaly Detection, page 40-6](#)

## Worm Viruses

Worm viruses are automated, self-propagating, intrusion agents that make copies of themselves and then facilitate their spread. Worm viruses attack a vulnerable host, infect it, and then use it as a base to attack other vulnerable hosts. They search for other hosts by using a form of network inspection, typically a scan, and then propagate to the next target. A scanning worm virus locates vulnerable hosts by generating a list of IP addresses to probe, and then contacts the hosts. Code Red worm, Sasser worm, Blaster worm, and the Slammer worm are examples of worms that spread in this manner.

Anomaly detection identifies worm-infected hosts by their behavior as a scanner. To spread, a worm virus must find new hosts. It finds them by scanning the Internet using TCP, UDP, and other protocols to generate unsuccessful attempts to access different destination IP addresses. A scanner is defined as a source IP address that generates events on the same destination port (in TCP and UDP) for too many destination IP addresses.

The events that are important for TCP are non-established connections, such as a SYN packet that does not have its SYN-ACK response for a given amount of time. A worm-infected host that scans using TCP generates non-established connections on the same destination port for an anomalous number of IP addresses.

The events that are important for UDP are unidirectional connections, such as a UDP connection where all packets are going in only one direction. A worm-infected host that scans using UDP generates UDP packets but does not receive UDP packets on the same IP address within a time-out period on the same destination port for multiple destination IP addresses.

The events that are important for other protocols, such as ICMP (protocol number 1), are from a source IP address to many different destination IP addresses, that is, packets that are received in only one direction.

### Caution

---

If a worm virus has a list of IP addresses it should infect and does not have to use scanning to spread itself (for example, it uses passive mapping—listening to the network as opposed to active scanning), it will not be detected by anomaly detection worm policies. Worm viruses that receive a mailing list from probing files within the infected host and email this list will not be detected, because no Layer 3 or Layer 4 anomaly is generated.

---

## Anomaly Detection Modes

Anomaly detection initially conducts a “peacetime” learning process when the most normal state of the network is reflected. Anomaly detection then derives a set of policy thresholds that best fit the normal network. This is done in two phases: an initial learning mode phase, followed by the ongoing operational detect mode phase.

Anomaly detection has the following modes:

- Learning accept mode (initial setup)

Although anomaly detection is in detect mode by default, it conducts an initial learning accept mode for the default period of 24 hours. We assume that during this phase no attack is being carried out. Anomaly detection creates an initial baseline, known as a knowledge base, of the network traffic. The default interval value for periodic schedules is 24 hours and the default action is rotate, meaning that a new knowledge base is saved and loaded, and then replaces the initial knowledge base after 24 hours.

Keep the following in mind:

- Anomaly detection does not detect attacks when working with the initial knowledge base, which is empty. After the default of 24 hours, a knowledge base is saved and loaded and now anomaly detection also detects attacks.
  - Depending on your network complexity, you may want to have anomaly detection in learning accept mode for longer than the default 24 hours. You configure the mode in the Virtual Sensors policy; see [Defining A Virtual Sensor, page 37-5](#). After your learning period has finished, edit the virtual sensor and change the mode to Detect.
- Detect mode

For ongoing operation, the sensor should remain in detect mode. This is for 24 hours a day, 7 days a week. Once a knowledge base is created and replaces the initial knowledge base, anomaly detection detects attacks based on it. It looks at the network traffic flows that violate thresholds in the knowledge base and sends alerts. As anomaly detection looks for anomalies, it also records gradual changes to the knowledge base that do not violate the thresholds and thus creates a new knowledge base. The new knowledge base is periodically saved and takes the place of the old one thus maintaining an up-to-date knowledge base.

- Inactive mode

You can turn anomaly detection off by putting it in inactive mode. Under certain circumstances, anomaly detection should be in inactive mode, for example, if the sensor is running in an asymmetric environment. Because anomaly detection assumes it gets traffic from both directions, if the sensor is configured to see only one direction of traffic, anomaly detection identifies all traffic as having incomplete connections, that is, as scanners, and sends alerts for all traffic flows.

The following example summarizes the default anomaly detection configuration. If you add a virtual sensor at 11:00 pm and do not change the default anomaly detection configuration, anomaly detection begins working with the initial knowledge base and only performs learning. Although it is in detect mode, it cannot detect attacks until it has gathered information for 24 hours and replaced the initial knowledge base. At the first start time (10:00 am by default), and the first interval (24 hours by default), the learning results are saved to a new knowledge base and this knowledge base is loaded and replaces the initial knowledge base. Because the anomaly detection is in detect mode by default, now that anomaly detection has a new knowledge base, the anomaly detection begins to detect attacks.

## Anomaly Detection Zones

By subdividing the network into zones, you can achieve a lower false negative rate. A zone is a set of destination IP addresses. There are three zones, each with its own thresholds: internal, illegal, and external.

The external zone is the default zone with the default Internet range of 0.0.0.0-255.255.255.255. By default, the internal and illegal zones contain no IP addresses. Packets that do not match the set of IP addresses in the internal or illegal zone are handled by the external zone.

We recommend that you configure the internal zone with the IP address range of your internal network. If you configure it in this way, the internal zone is all the traffic that comes to your IP address range, and the external zone is all the traffic that goes to the Internet.

You can configure the illegal zone with IP address ranges that should never be seen in normal traffic, for example, unallocated IP addresses or part of your internal IP address range that is unoccupied. An illegal zone can be very helpful for accurate detection, because we do not expect any legal traffic to reach this zone. This allows very low thresholds, which in turn can lead to very quick worm virus detection.

## Knowing When to Turn Off Anomaly Detection

Anomaly detection assumes that it gets traffic from both directions. If the sensor is configured to see only one direction of traffic, you should turn off anomaly detection. Otherwise, when anomaly detection is running in an asymmetric environment, it identifies all traffic as having incomplete connections, that is, as scanners, and sends alerts for all traffic flows.

You turn off anomaly detection in the Virtual Sensors policy. Edit the virtual sensor for which you are disabling anomaly detection, and change the Anomaly Detection Mode to Inactive. For information on editing virtual sensors, see [Editing Policies for a Virtual Sensor, page 37-9](#).

## Configuring Anomaly Detection Signatures

The Traffic Anomaly engine contains nine anomaly detection signatures covering three protocols (TCP, UDP, and other). Each signature has two subsignatures, one for the scanner and the other for the worm-infected host (or a scanner under worm attack). When anomaly detection discovers an anomaly, it triggers an alert for these signatures. All anomaly detection signatures are enabled by default and the alert severity for each one is set to high.

When a scanner is detected but no histogram anomaly occurred, the scanner signature fires for that attacker (scanner) IP address. If the histogram signature is triggered, the attacker addresses that are doing the scanning each trigger the worm signature (instead of the scanner signature). The alert details state which threshold is being used for the worm detection now that the histogram has been triggered. From that point on, all scanners are detected as worm-infected hosts.

The following anomaly detection event actions are possible:

- Produce alert—Writes the event to the Event Store.
- Deny attacker inline—(Inline only) Does not transmit this packet and future packets originating from the attacker address for a specified period of time.
- Log attacker packets—Starts IP logging for packets that contain the attacker address.
- Deny attacker service pair inline—Blocks the source IP address and the destination port.
- Request SNMP trap—Sends a trap notification to an SNMP trap destination. To use this action, you must configure SNMP trap hosts as described in [Configuring SNMP, page 35-8](#).
- Request block host—Sends a request to ARC to block this host (the attacker). To use this action, you must configure blocking devices as described in [Configuring IPS Blocking and Rate Limiting, page 42-7](#).

You can add actions to the signatures either directly, in the Signatures policy, or to events generated by the signatures based on risk rating in the Event Actions Overrides policy.

The following table lists the anomaly detection worm signatures.

**Table 40-1** Anomaly Detection Worm Signatures

| Signature ID | Subsignature ID | Name                   | Description                                                                                                                                                          |
|--------------|-----------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13000        | 0               | Internal TCP Scanner   | Identified a single scanner over a TCP protocol in the internal zone.                                                                                                |
| 13000        | 1               | Internal TCP Scanner   | Identified a worm attack over a TCP protocol in the internal zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13001        | 0               | Internal UDP Scanner   | Identified a single scanner over a UDP protocol in the internal zone.                                                                                                |
| 13001        | 1               | Internal UDP Scanner   | Identified a worm attack over a UDP protocol in the internal zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13002        | 0               | Internal Other Scanner | Identified a single scanner over an Other protocol in the internal zone.                                                                                             |
| 13002        | 1               | Internal Other Scanner | Identified a worm attack over an Other protocol in the internal zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |
| 13003        | 0               | External TCP Scanner   | Identified a single scanner over a TCP protocol in the external zone.                                                                                                |
| 13003        | 1               | External TCP Scanner   | Identified a worm attack over a TCP protocol in the external zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13004        | 0               | External UDP Scanner   | Identified a single scanner over a UDP protocol in the external zone.                                                                                                |
| 13004        | 1               | External UDP Scanner   | Identified a worm attack over a UDP protocol in the external zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13005        | 0               | External Other Scanner | Identified a single scanner over an Other protocol in the external zone.                                                                                             |
| 13005        | 1               | External Other Scanner | Identified a worm attack over an Other protocol in the external zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |
| 13006        | 0               | Illegal TCP Scanner    | Identified a single scanner over a TCP protocol in the illegal zone.                                                                                                 |

| 13007        | 0               | Illegal UDP Scanner   | Identified a single scanner over a UDP protocol in the illegal zone.                                                                                                |
| 13007        | 1               | Illegal UDP Scanner   | Identified a worm attack over a UDP protocol in the illegal zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13008        | 0               | Illegal Other Scanner | Identified a single scanner over an Other protocol in the illegal zone.                                                                                             |
| 13008        | 1               | Illegal Other Scanner | Identified a worm attack over an Other protocol in the illegal zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |

## Configuring Anomaly Detection

Use the Anomaly Detection policy to configure anomaly detection settings. The Virtual Sensors policy also contains a setting important for anomaly detection.

This procedure explains the overall configuration of anomaly detection. Before configuring these settings, read the following topics:

- [Understanding Anomaly Detection, page 40-1](#)
- [Worm Viruses, page 40-2](#)
- [Anomaly Detection Modes, page 40-2](#)
- [Anomaly Detection Zones, page 40-3](#)
- [Knowing When to Turn Off Anomaly Detection, page 40-4](#)
- [Configuring Anomaly Detection Signatures, page 40-4](#)

---

**Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:

- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
- (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.

The Anomaly detection policy includes these tabs:

- **Operation Settings**—Defines the worm timeout and identifies any IP addresses that should be ignored by anomaly detection.

- **Learning Accept Mode**—The configuration for learning mode, including how the knowledge base is handled.
- **Internal Zone, Illegal Zone, External Zone**—The zones of your network that you define. You can configure unique settings for each zone. For an explanation of the zones, see [Anomaly Detection Zones, page 40-3](#).

**Step 2** Click the **Operation Settings** tab, if necessary, and configure the following:

- **Worm Timeout**—The time in seconds for the worm termination timeout. The range is 120 to 10,000,000 seconds. The default is 600 seconds. For an explanation of how this timeout is used, see [Understanding Anomaly Detection Thresholds and Histograms, page 40-9](#).
- **Enable Ignored Addresses and Source/Destination Addresses to Ignore**—Whether you are configuring a list of addresses that should be ignored while anomaly detection is processing. You can specify a list of source addresses (those that initiate a scan) or destination addresses (the hosts that are scanned).

The addresses can be single host (such as 10.100.10.1), a range of addresses (such as 10.100.10.0-10.100.10.255), or network/host objects that contain single hosts, address ranges, or a combination of hosts and ranges. Click **Select** to select objects from a list or to create new objects.

**Step 3** Click the **Learning Accept Mode** tab and define how the knowledge base will be generated and used. For detailed information, see [Configuring Anomaly Detection Learning Accept Mode, page 40-8](#).

**Step 4** Configure the internal, illegal, and external zones:

- Define the internal and illegal zones—The internal zones are the IP addresses of your internal network, the network that you manage. The illegal zone should represent IP address ranges that should never be seen in normal traffic, for example, unallocated IP addresses or part of your internal IP address range that is unoccupied.

Click the **Internal Zone** and **Illegal Zone** tabs in turn and configure the following on the **General** tab:

- **Enable this zone**—Whether the zone will be processed by anomaly detection.
- **Service Subnets**—The IP addresses that comprise the zone. The default (0.0.0.0) is that no address is included in the zone. Replace 0.0.0.0 to define addresses for the zone.

The addresses can be single host (such as 10.100.10.1), a range of addresses (such as 10.100.10.0-10.100.10.255), or network/host objects that contain single hosts, address ranges, or a combination of hosts and ranges. Click **Select** to select objects from a list or to create new objects.

- Decide whether to enable the external zone—The external zone comprises all IP addresses that are not configured for the internal or illegal zones. You do not explicitly assign addresses to this zone. On the **External Zone** tab, **General** sub-tab, you can enable or disable the zone using the **Enable this zone** checkbox. The external zone is enabled by default.
- Configure scanner thresholds and histograms—Each zone has sub-tabs for **TCP Protocol**, **UDP Protocol**, and **Other Protocols**. On these tabs, you can configure non-default settings for specific services that override the learned histograms. For detailed information about configuring these settings, see [Configuring Anomaly Detection Thresholds and Histograms, page 40-11](#).

At this point, you have finished configuring the basic anomaly detection settings.

**Step 5** (Device view only.) Configure the anomaly detection mode. This setting is defined in the **Virtual Sensors** policy. Consider the following tips to select the correct policy:

- If you configured the anomaly detection policy on a virtual sensor (other than vs0, which is represented by the parent IPS device), you must select the parent IPS device, then select the Virtual Sensors policy.

- If you configured the Anomaly Detection policy as a shared policy in Policy view, select the IPS device to which the policy is assigned, or that hosts a virtual sensor to which the policy is assigned.

Then, complete the following steps in the Virtual Sensors policy:

- a. Select the desired virtual sensor in the table and click the **Edit Row** button.
- b. In the Modify Virtual Sensors dialog box, select the appropriate option for the Anomaly Detection Mode setting: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see [Anomaly Detection Modes, page 40-2](#). For information about the other settings in this dialog box, see [Virtual Sensor Dialog Box, page 37-7](#).
- c. If you placed anomaly detection in Learning mode, remember to change the mode to Detect after the desired learning period has completed.

**Step 6** Add additional actions to the anomaly detection signatures, if desired. For example, you might want to add a deny action so that attacks are dropped. You can alternatively configure event action overrides to add actions based on risk rating. For more information, see [Configuring Anomaly Detection Signatures, page 40-4](#).

**Step 7** Manage the knowledge base, if necessary.

If you configured the knowledge base to automatically rotate (on the Learning Accept Mode tab), then the knowledge base is refreshed automatically and manual intervention is not necessary.

If you configured anomaly detection to only save new databases, and not use them, then you need to manually load updated knowledge bases periodically. You cannot do this in Security Manager; use the IPS Device Manager (IDM) instead.

Using IDM (or IME), you can load, delete, and rename knowledge bases, and upload them to or download them from an external server. For more information about what you can do, see the online help for IDM or IME.

## Configuring Anomaly Detection Learning Accept Mode

Use the Learning Accept Mode tab of the Anomaly Detection policy to configure whether you want the sensor to create a new knowledge base every so many hours. You can configure whether the knowledge base is created and loaded (Rotate) or saved (Save Only). You can schedule how often and when the knowledge base is loaded or saved.

The default generated filename is YYYY-Mon-dd-hh\_mm\_ss (that is, year-month-day-hour\_minute\_second), where Mon is a three-letter abbreviation of the current month.

The knowledge base has a tree structure and contains the following information:

- Knowledge base name
- Zone name
- Protocol
- Service

The knowledge base holds a scanner threshold and a histogram for each service. If you have learning accept mode set to automatic and the action set to rotate, a new knowledge base is created every 24 hours and used in the next 24 hours. If you have learning accept mode set to automatic and the action is set to save only, a new knowledge base is created but not loaded, and the current knowledge base is used. If you do not have learning accept mode set to automatic, no knowledge base is created.

**Tip**

Although you can use Security Manager to configure how knowledge bases are generated, you cannot manage the knowledge bases themselves. Use the IPS Device Manager (IDM), or IPS Manager Express (IME) instead. Using IDM (or IME), you can load, delete, and rename knowledge bases, and upload them to or download them from an external server. For more information about what you can do, see the online help for IDM or IME.

**Related Topics**

- [Anomaly Detection Modes, page 40-2](#)
- [Configuring Anomaly Detection, page 40-6](#)
- [Understanding Anomaly Detection Thresholds and Histograms, page 40-9](#)

- 
- Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:
- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
  - (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.
- Step 2** Click the **Learning Accept Mode** tab and configure the following options:
- **Automatically accept learning knowledge base**—Whether to have the sensor automatically update the knowledge base. If you do not select this option, anomaly detection does not automatically create a new knowledge base, and you cannot configure the other options on this tab.
  - **Action**—Whether to rotate or save the knowledge base when it is created.
 

If you choose **Rotate** (the default), the new knowledge base is created and loaded according to the schedule you define. If you choose **Save Only**, the new knowledge base is created but not loaded. You can examine it and decide whether to load it into anomaly detection using IDM or IME.
- Step 3** In the **Schedule** field, select the schedule for generating a new knowledge base. The default schedule is periodic starting at 10 AM and running for 24 hours. Options are:
- **Periodic**—Base the schedule on a recurring period. Configure the following options:
    - **Start Time**—The starting time for the learning window in hh:mm:ss format (24-hour clock).
    - **Learning Interval in hours**—How long you want anomaly detection to learn from the network before creating a new knowledge base.
  - **Calendar Schedule**—Base the schedule on specific times of day and days of the week. The dialog box changes to show Time of Day and Days of the Week tables. These times apply to every day selected; you cannot specify different times for different days.
    - To add a time or day, click the **Add Row (+)** button beneath the appropriate table. The time is in hh:mm:ss format (24-hour clock). For day, select the day from the list.
    - To edit an existing time or day, select it and click the **Edit Row (pencil)** button.
    - To delete a time or day, select it and click the **Delete Row (trash can)** button. Ensure that you have at least one time and one day configured.
- 

## Understanding Anomaly Detection Thresholds and Histograms

Anomaly detection uses thresholds and histograms to determine if scanning behavior is an attack.

During learning mode, anomaly detection develops histograms for each TCP and UDP port, and for other protocols, to create a baseline of the normal behavior of your network (see [Anomaly Detection Modes, page 40-2](#)). For example, the histogram for a TCP port lists the “normal” number of source addresses that make incomplete connections to a certain number of destination addresses during a minute. The histograms contain three buckets: low number of destination addresses (5), medium number (20), and high number (100). (The destination buckets are a fixed number.) Separate histograms are kept for each service and zone (see [Anomaly Detection Zones, page 40-3](#)).

For example, learning mode might develop the following histogram for TCP port 80:

| Number of Destination Addresses | Number of Source Addresses |
|---------------------------------|----------------------------|
| Low (5)                         | 18                         |
| Medium (20)                     | 6                          |
| High (100)                      | 2                          |

In addition to these learned histograms, the anomaly detection scanner has a threshold setting that you configure. You configure a general scanner threshold, and you can override the threshold (configuring a different value) for any specific service (TCP port, UDP port, or other protocol). Each zone has its own thresholds.

When anomaly detection moves to detect mode, where it is actively scanning for worms, the thresholds and histograms are used as follows:

- Histograms are ignored until the threshold for the service is exceeded. For example, consider the above table for TCP/80 traffic. If the threshold is set at 200 (the default), a scanner must scan 200 hosts in a minute to trigger a scanner alert. If 7 source addresses scanned 50 hosts (which is an anomaly in the histogram, which expects no more than 6 hosts scanning 20-99 destinations), but a single scanner scanned only 100 addresses, no alert is generated, and no anomaly is detected.
- When the scanner threshold is exceeded, anomaly detection uses the histogram to determine if the service is under worm attack. In this example, if a source scans more than 200 destinations, anomaly detection evaluates the collected activity in the network. Because 7 hosts have scanned 50 hosts, a worm alert is generated.

When under worm attack, anomaly detection stops learning and clears the current learning information. It also temporarily lowers the thresholds.

- When a worm attack is detected, the worm timeout counter is started. When the timeout is reached, the scanner is reset. If the worm attack continues, new alerts are generated. You configure the worm timeout on the Operation Settings tab of the Anomaly Detection policy.

If you leave the defaults in place, anomaly detection generates histograms based on what it learns about your network from the network’s actual behavior. However, if you understand your network you can fine-tune these histograms to reduce false positives, creating your own definition of expected (or desired or tolerated) behavior for each TCP/UDP port or other protocol, for each zone. You can create your own histograms for only those services that interest you, and leave the defaults for all other ports. Additionally, you can configure the general scanner threshold for each zone, and configure different thresholds for specific services.

For information on configuring thresholds and histograms, see [Configuring Anomaly Detection Thresholds and Histograms, page 40-11](#).

## Configuring Anomaly Detection Thresholds and Histograms

Anomaly detection uses thresholds and histograms to determine if scanning behavior is an attack. In most cases, you can use the default thresholds and the histograms that anomaly detection generates during learning mode (see [Anomaly Detection Modes, page 40-2](#)). However, you might want to fine-tune these settings. Changing the thresholds is a more likely change than creating your own histograms.

Before you configure these settings, read [Understanding Anomaly Detection Thresholds and Histograms, page 40-9](#). You must understand how thresholds and histograms are used together to configure them.

- 
- Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:
- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
  - (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.
- Step 2** Click the tab for the zone whose thresholds or histograms you want to change. You configure separate values for each zone: **Internal Zone**, **Illegal Zone**, **External Zone**. For an explanation of the zones, see [Anomaly Detection Zones, page 40-3](#).
- The tabs for each zone contain four sub-tabs: General, TCP Protocol, UDP Protocol, and Other Protocols. The General tab defines the IP addresses for the zone and whether the zone is enabled (the External zone includes all IP addresses not specified for the other zones, you do not configure specific addresses for the External zone).
- The other tabs are where you define thresholds and histograms.
- Step 3** Select the tab for the protocol for which you want to modify thresholds or histograms: **TCP Protocol**, **UDP Protocol**, **Other Protocol**.
- On each tab, configure the following options:
- **Enabled**—Whether anomaly detection is enabled for the protocol. You can turn off detection for all of TCP, UDP, or for all non-TCP/UDP protocols with this option. If you deselect the option, any other settings configured on the tab are ignored.
  - **Destination Port Map** or **Protocol Number Map** table—This table lists the TCP/UDP ports, or other protocols, for which you are configuring non-default mappings. By default, all ports and protocols are enabled and use the default scanner threshold.

Add items to this table only if you want to: disable detection for a port or protocol; set a different threshold value for a port or protocol; or configure an explicit histogram for a port or protocol, which will be used instead of the learned histogram.

    - To add a mapping, click the **Add Row (+)** button and fill in the Add Dest or Protocol Map dialog box. For detailed information, see [Dest Port or Protocol Map Dialog Box, page 40-12](#).
    - To edit a mapping, select it and click the **Edit Row (pencil)** button.
    - To delete a mapping, select it and click the **Delete Row (trash can)** button. Deleting a mapping returns the service to the default settings.
  - **Scanner Threshold**—The threshold for all TCP, UDP, or other protocols. This threshold is used for all services except those for which you configured a scanner override in the mapping table. The range is 5 to 1000. The default is 200.
  - **Threshold Histogram**—The default histogram for all TCP, UDP, or other protocols. This histogram is used for all services except those for which you configured a scanner override in the mapping table.

The content of this table is fixed; you cannot add or delete items. However, you can select a row and click **Edit Row (pencil)** to change the number of source addresses configured for a threshold setting. See [Histogram Dialog Box, page 40-13](#).

- Step 4** Repeat the process for each combination of zone and protocol for which you are defining non-default settings.

## Dest Port or Protocol Map Dialog Box

Use the Add or Modify Dest Port Map dialog box to add or modify destination port scanner settings for TCP or UDP, and the Add or Modify Protocol Map dialog box to add or modify scanner settings for other protocols.

Before you configure these settings, read the following topics:

- [Understanding Anomaly Detection Thresholds and Histograms, page 40-9](#)
- [Configuring Anomaly Detection Thresholds and Histograms, page 40-11](#)

### Tip

You do not need to add a port or protocol to have anomaly detection look for worm attacks against it. By default, all ports and protocols are processed. You need to configure specific settings only if you want to turn off detection on a specific port or protocol, or if you want non-default thresholds or histograms.

### Navigation Path

In the Anomaly Detection policy, on the **TCP Protocol**, **UDP Protocol**, or **Other Protocol** sub tabs on the Internal Zone, Illegal Zone, or External Zone tabs, click the **Add Row** button beneath the Destination Port Map or Protocol Number Map tables, or select a row and click the **Edit Row** button. For more information on the steps required to get here, see [Configuring Anomaly Detection Thresholds and Histograms, page 40-11](#).

If you do not enable the service, the associated port or protocol is not processed by anomaly detection.                                                                                                                                                                                                                        |

**Table 40-2 Destination Port or Protocol Map Dialog Box (Continued)**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Override Scanner Settings | Whether to override the scanner settings for this service or protocol. You must select this option to enable the remaining fields on the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Scanner Threshold         | The scanner threshold for this port or protocol. The range is 5 to 1000. The default is 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Threshold Histogram table | <p>The histograms for this port or protocol. If you leave the table empty, the default histograms are used. You can have up to three rows, for low, medium, and high numbers of destination addresses, with different threshold levels (source addresses) for each.</p> <ul style="list-style-type: none"> <li>To add a threshold, click the <b>Add Row</b> button and fill in the <a href="#">Histogram Dialog Box, page 40-13</a>. The Add button is disabled if you already have three rows.</li> <li>To edit a threshold, select it and click the <b>Edit Row</b> button. You cannot change the destination bucket to one that is already defined in the table.</li> <li>To delete a threshold, select it and click the <b>Delete Row</b> button. Any buckets not included in the table use the default histogram for the bucket.</li> </ul> |

## Histogram Dialog Box

Use the Histogram dialog box to create or modify entries in a histogram. The histograms you create or modify override the default histograms that anomaly detection generates. For detailed information about how these histograms are used, see:

- [Understanding Anomaly Detection Thresholds and Histograms, page 40-9](#)
- [Configuring Anomaly Detection Thresholds and Histograms, page 40-11](#)

### Navigation Path

Do one of the following from the Anomaly Detection policy (see [Configuring Anomaly Detection, page 40-6](#)):

- On the TCP Protocol, UDP Protocol, or Other Protocol sub tabs on the Internal Zone, Illegal Zone, or External Zone tabs, select a row in the Threshold Histogram table and click the **Edit Row** button.
- On the Add or Modify Dest or Protocol Map dialog boxes, click the **Add Row** button, or select a row and click the **Edit Row** button. For information on opening the map dialog boxes, see [Dest Port or Protocol Map Dialog Box, page 40-12](#).

## Field Reference

Table 40-3 Histogram Dialog Box

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of Destination IP Addresses | <p>The histogram bucket you are defining. The buckets have a fixed number of destination addresses: Low (5 addresses); Medium (20); High (100).</p> <p><b>Tip</b> A histogram can have a single entry for each destination bucket (low, medium, high). Thus, you cannot change this value to one that is already defined in the histogram you are editing.</p> |
| Number of Source IP Addresses      | <p>The number of source addresses that are allowed to simultaneously scan the associated number of destination addresses. Enter the desired number.</p> <p>The range is 0 to 4096. If you are editing a histogram, the current value is shown.</p>                                                                                                             |

# CHAPTER 41

## Configuring Global Correlation

---

You can configure global correlation so that your sensors are aware of network devices with a reputation for malicious activity and can take action against them. Global correlation allows you to dynamically use information about malicious activity collected from networks around the globe to change the risk rating of events that have known bad devices as their source.

To configure global correlation, your sensor must be running IPS 7.0+ software. Global correlation is not available on Cisco IOS IPS devices.

This chapter contains the following topics:

- [Understanding Global Correlation, page 41-1](#)
- [Configuring Global Correlation Inspection and Reputation, page 41-5](#)
- [Configuring Network Participation, page 41-7](#)

## Understanding Global Correlation

You can configure global correlation so that your sensors are aware of network devices with a reputation for malicious activity and can take action against them. Participating IPS devices in a centralized Cisco threat database, the SensorBase, receive and absorb global correlation updates. The reputation data contained in the global correlation updates is factored into the analysis of network traffic, which increases IPS efficacy, because traffic is denied or allowed based on the reputation of the source IP address. The participating IPS devices send data back to the Cisco SensorBase Network, which results in a feedback loop that keeps the updates current and global.

Tip

---

The Botnet Traffic Filter feature of adaptive security appliances (ASA) is another dynamic feature you can deploy in your network to defend against malicious activity. Configuring global correlation on IPS devices, and Botnet Traffic Filtering on ASA firewalls, can be an effective combined security implementation. For more information about Botnet Traffic Filtering, see [Chapter 19, “Managing Firewall Botnet Traffic Filter Rules”](#).

---

There are three main features of global correlation:

- **Global Correlation Inspection**—The IPS uses the global correlation reputation knowledge of attackers to influence alert handling and to deny actions when attackers with a bad score are seen on the sensor. For more information about reputation, see [Understanding Reputation, page 41-2](#).
- **Reputation Filtering**—Applies automatic deny actions to packets from known malicious sites.

- Network Participation—The sensor sends alert and TCP fingerprint data to the SensorBase Network so that other users can share in the community knowledge. For more information, see [Understanding Network Participation, page 41-3](#).

Global correlation has the following goals:

- Dealing intelligently with alerts thus improving efficacy.
- Improving protection against known malicious sites.
- Sharing telemetry data with the SensorBase Network to improve visibility of alerts and sensor actions on a global scale.
- Simplifying configuration settings.
- Automatic handling of the uploads and downloads of the information.

**Tip**

You can use Report Manager to generate reports comparing the number of alerts generated by global correlation to those generated by traditional IPS inspection. For information on the Inspection/Global Correlation report, see [Understanding General IPS Reports, page 67-17](#). For information on generating reports, see [Opening and Generating Reports, page 67-18](#).

For information on how to configure global correlation, see the following topics:

- [Global Correlation Requirements and Limitations, page 41-4](#)
- [Configuring Global Correlation Inspection and Reputation, page 41-5](#)
- [Configuring Network Participation, page 41-7](#)

## Understanding Reputation

Similar to human social interaction, reputation is an opinion toward a device on the Internet. Reputation indicates the probability that a particular attacker IP address will initiate malicious behavior based on its known past activity. Reputation enables the installed base of IPS sensors to collaborate using the existing network infrastructure and identify network devices that are likely to be malicious or infected.

By collecting data about devices and assigning reputation scores to them, the global correlation database provides important data that the IPS sensor can use to adjust the risk rating of an attack. Risk rating is the probability that a network event is malicious. Each signature has an associated risk rating. If you enable global correlation, the IPS sensor computes a score based on the reputation of an attacker and adds this score to the risk rating of the event. The updated risk rating is then used by your event action override and filter policies to help determine what actions to take for the event.

Thus, you might have an event that is initially configured to simply produce an alert. But, if the attacker has a bad reputation, the IPS might increase the risk rating to a number high enough that it triggers an event action override rule that adds the Deny Packet Inline action. Thus, for some source devices, the event simply produces an alert, but for others, the event drops the packet in addition to producing the alert.

**Tip**

The Produce Alert action is added to an event whenever global correlation raises the risk rating of the event, or when global correlation adds the Deny Packet Inline or Deny Attacker Inline actions.

Because the global correlation database changes rapidly, the sensor must periodically download global correlation updates from the global correlation servers.

Using reputation scores to adjust the risk rating of an event improves the efficacy of the sensor by improving the following metrics:

- False positives as a percentage of actionable events.
- False negatives as a percentage of threats that do not result in actionable events.
- Actionable events as a percentage of all events.

- [Configuring Network Participation, page 41-7](#)

## Understanding Network Participation

Network participation lets Cisco collect nearly real-time data from sensors around the world. Sensors installed at customer sites can send data to the SensorBase Network. These data feed in to the global correlation database to increase reputation fidelity. Communication between sensors and the SensorBase Network involves an HTTPS request and response over TCP/IP.

There are three modes for Network Participation:

- **Off**—The Network Participation server does not collect data, track statistics, or try to contact the Cisco SensorBase network.
- **Partial Participation**—The Network Participation server collects data, tracks statistics, and communicates with the SensorBase network. Data considered to be potentially sensitive is filtered out and never sent.

---

**Note** Configuring the sensor for partial network participation limits a third party from extracting reconnaissance information about your internal network from the global correlation database.

---

- **Full Participation**—The Network Participation server collects data, tracks statistics, and communicates with the SensorBase network. All data collected is sent.

If you select partial or full participation, you are prompted to accept a participation agreement. You must accept the agreement to participate or you cannot change the participation mode.

The following table explains the data collected and the purpose of collecting it.

**Table 41-1 Network Participation Data Sharing and Usage**

| Participation Level | Type of Data                                                                                                 | Purpose                                                                 |
|---------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Partial             | Protocol attributes (TCP maximum segment size and options string, for example).                              | Tracks potential threats and helps Cisco to understand threat exposure. |
|                     | Attack type (signature fired, including signature ID and version, risk rating, and reputation, for example). | Used to understand current attacks and attack severity.                 |
|                     | Connecting IP address and port.                                                                              | Identifies attack source.                                               |
|                     | Summary IPS performance (CPU utilization, memory usage, inline vs promiscuous, for example).                 | Tracks product efficacy.                                                |
| Full                | Victim IP address and port.                                                                                  | Detects threat behavioral pattern.                                      |

To configure network participation, the IPS device requires at least 100 MB of available memory, a network connection to the sensor, and a network connection to the Internet. For information on configuring network participation, see [Configuring Network Participation, page 41-7](#).

## Global Correlation Requirements and Limitations

The following list explains the requirements that you must meet to configure and successfully use global correlation on IPS devices. It also explains some limitations.

- **Valid license**—You must have a valid sensor license for global correlation features to function. You can still configure and display statistics for the global correlation features, but the global correlation databases are cleared and no updates are attempted. Once you install a valid license, the global correlation features are reactivated. For information on configuring licenses, see [Updating IPS License Files, page 43-1](#).
- **Agree to Network Participation disclaimer**—If you decide to configure network participation, you must accept the disclaimer. For more information, see [Understanding Network Participation, page 41-3](#) and [Configuring Network Participation, page 41-7](#).
- **External connectivity for sensor and a DNS server or HTTP proxy**—Global correlation requires the sensor to connect to the Cisco SensorBase Network. Domain name resolution is also required for these features to function. You can either configure the sensor to connect through an HTTP proxy server that has a DNS client running on it, or you can assign an Internet routeable address to the management interface of the sensor and configure the sensor to use a DNS server. For more information, see [Identifying DNS Servers, page 35-22](#) and [Identifying an HTTP Proxy Server, page 35-23](#).
- **Sensor in inline mode**—The sensor must operate in inline mode so that the global correlation features can increase efficacy by being able to use the inline deny actions.
- **Sensor and IPS version that supports the global correlation features**—The sensor must run IPS 7.0+ software. You cannot configure global correlation on Cisco IOS IPS devices.
- **Sufficient available memory**—To configure network participation, the IPS device requires at least 100 MB of available memory.

- **Firewall access for port 80, 443 traffic**—Because global correlation updates occur through the sensor management interface, any firewall that lies between the sensor and the internet must allow traffic on ports 80 and 443. You can also use an HTTP proxy (see [Identifying an HTTP Proxy Server, page 35-23](#)).
- **Exposure to external traffic**—The global correlation database contains external IP addresses only, so if you position a sensor in an internal lab that has no interaction with outside networks, you might never receive global correlation information. The feature will have no effect.
- **Bypass mode might be triggered during global correlation updates**—As with signature updates, when the sensor applies a global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.
- **No IPv6 address support**—Global correlation inspection and the reputation filtering deny features do not support IPv6 addresses. For global correlation inspection, the sensor does not receive or process reputation data for IPv6 addresses. The risk rating for IPv6 addresses is not modified for global correlation inspection. Similarly, network participation does not include event data for attacks from IPv6 addresses. And finally, IPv6 addresses do not appear in the deny list.

- [Configuring Network Participation, page 41-7](#)

## Configuring Global Correlation Inspection and Reputation

Use the Inspection/Reputation policy to configure the sensor to use updates from the SensorBase Network to adjust the risk rating of events. The global correlation client on the sensor determines which updates are available and applicable to the sensor by communicating with the global correlation update server and a file server. The global correlation update server provides the server manifest document to the sensor, which identifies which updates are available and how to obtain them from a file server. The sensor downloads the update files from the file server using the information in the server manifest.

When you configure global correlation, updates are automatic and happen at regular intervals, approximately every five minutes by default, but this interval can be modified by the global correlation server. The sensor initially gets a full update and then applies an incremental update periodically.

If you turn on global correlation, you can choose how aggressively you want the deny actions to be enforced against malicious hosts. You can then enable reputation filtering to deny access to known malicious hosts. If you only want a report of what could have happened, you can enable Test Global Correlation. This puts the sensor in Audit mode, and actions the sensor would have performed are generated in the events.

**Tip**

When you view IPS events in Event Viewer, there are several columns specific to global correlation that you can add to the event table; these columns are not shown by default, so you must add them to your view. To monitor global correlation in general, use the IPS device manager (IDM) and look at the Sensor Health gadget. Use either the full IDM or open a read-only copy from Security Manager by right-clicking the device in Device view and selecting **Device Manager**.

**Before You Begin**

- You must also configure a DNS server or HTTP proxy for global correlation to function. For details, see [Identifying DNS Servers, page 35-22](#) or [Identifying an HTTP Proxy Server, page 35-23](#).
- There are several configuration requirements and limitations that you should be aware of before configuring global configuration. For details, see [Global Correlation Requirements and Limitations, page 41-4](#).

**Related Topics**

- [Understanding Global Correlation, page 41-1](#)
- [Understanding Reputation, page 41-2](#)
- [Configuring Network Participation, page 41-7](#)

**Step 1**

Do one of the following to open the Inspection/Reputation policy:

- (Device view) Select **IPS > Global Correlation > Inspection/Reputation** from the Policy selector.
- (Policy view) Select **IPS > Global Correlation > Inspection/Reputation** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

Configure the following settings:

- **Global Correlation Inspection**—Whether to enable global correlation inspection. When turned on, the sensor uses updates from the SensorBase Network to adjust the risk rating. Deselect this option to disable inspection.
- **Global Correlation Influence**—How aggressively the sensor uses global correlation information to initiate deny actions. Select one of the following:
  - **Permissive**—Has the least aggressive effect on deny actions.
  - **Standard**—(The default.) Has a moderately aggressive effect on deny actions.
  - **Aggressive**—Has a very aggressive effect on deny actions.
- **Reputation Filtering**—Select whether you want reputation filtering **on** or **off**. When turned on, the sensor denies access to malicious hosts that are listed in the global correlation database.
- **Test Global Correlation**—Whether to place global correlation in audit mode. In audit mode, reputation filtering does not deny access to known malicious hosts; only a report of what could have happened is generated.

Audit mode allows you to test the global correlation features without actually denying any hosts. If you decide the effects are desirable, you can deselect this option to activate reputation filtering.

# Configuring Network Participation

Use the Network Participation policy to configure the sensor to send data to the SensorBase Network. You can configure the sensor to fully participate and send all data to the SensorBase Network, or you can configure the sensor to collect the data but to omit potentially sensitive data, such as the destination IP address of trigger packets. For detailed information about network participation and the data that is collected, see [Understanding Network Participation, page 41-3](#).

## Related Topics

- [Understanding Global Correlation, page 41-1](#)
- [Understanding Reputation, page 41-2](#)
- [Global Correlation Requirements and Limitations, page 41-4](#)
- [Configuring Global Correlation Inspection and Reputation, page 41-5](#)

- 
- Step 1** Do one of the following to open the Network Participation policy:
- (Device view) Select **IPS > Global Correlation > Network Participation** from the Policy selector.
  - (Policy view) Select **IPS > Global Correlation > Network Participation** from the Policy Type selector. Select an existing policy or create a new one.

- Step 2** Select the level of participation from the **Network Participation** list:
- **Off**—No data is contributed to the SensorBase network.
  - **Partial**—Data is contributed to the SensorBase network but potentially sensitive information is withheld.

### Note

---

Configuring the sensor for partial network participation limits a third party from extracting reconnaissance information about your internal network from the Global Correlation database.

---

- **Full**—All data is contributed to the SensorBase network.
- Step 3** If you select Full or Partial, when you click Save, the Network Participation Disclaimer dialog box opens, prompting you to read and accept a disclaimer. Carefully read the disclaimer. Click **Agree** if you agree to it.

If you click **Disagree**, you cannot enable network participation. Change the setting to Off and save the policy.

---

## CHAPTER 42

# Configuring Attack Response Controller for Blocking and Rate Limiting

You can configure an IPS device to implement blocks or rate limits to control attacks. Blocking and rate limiting are primarily of use when operating in promiscuous mode. When operating in inline mode, it is much more efficient to have the IPS drop traffic itself. Blocking and rate limiting are actions that other devices implement at the request of the IPS; thus, configuring blocking and rate limiting is a more complex configuration than simple inline denies.

To configure blocking or rate limiting, you must identify the network device that performs the blocking. A network device that performs blocking is called a blocking device. Many network devices can be used to support blocking: Cisco IOS routers and Catalyst 6500 switches, Cisco security appliances (ASA, PIX, and FWSM), and Catalyst 6500/7600 devices running the Catalyst operating system. You can also configure another IPS device to act as a master blocking sensor.

### Note

IPS blocking and rate limiting works only for IPS appliances and service modules. You cannot configure it for Cisco IOS IPS.

This chapter contains the following topics:

- [Understanding IPS Blocking, page 42-1](#)
- [Configuring IPS Blocking and Rate Limiting, page 42-7](#)
- [Blocking Page, page 42-8](#)

## Understanding IPS Blocking

The Attack Response Controller (ARC) component of the IPS is responsible for managing network devices in response to suspicious events by blocking access from attacking hosts and networks. ARC blocks the IP address on the devices it is managing. It sends the same block to all the devices it is managing, including any other master blocking sensors. ARC monitors the time for the block and removes the block after the time has expired.

### Note

ARC is formerly known as Network Access Controller. Although the name has been changed, the IPS documentation and configuration interfaces contain references to Network Access Controller, nac, and network-access.

ARC completes the action response for a new block in no more than 7 seconds. In most cases, it completes the action response in less time. To meet this performance goal, you should not configure the sensor to perform blocks at too high a rate or to manage too many blocking devices and interfaces. We recommend that the maximum number of blocks not exceed 250 and the maximum number of blocking items not exceed 10. To calculate the maximum number of blocking items, a security appliance counts as one blocking item per blocking context. A router counts as one blocking item per blocking interface/direction. A switch running Catalyst software counts as one blocking item per blocking VLAN. If the recommended limits are exceeded, ARC might not apply blocks in a timely manner or might not be able to apply blocks at all.

For security appliances configured in multiple-context mode, Cisco IPS does not include VLAN information in the block request. Therefore you must make sure the IP addresses being blocked are correct for each security appliance. For example, the sensor is monitoring packets on a security appliance customer context that is configured for VLAN A, but is blocking on a different security appliance customer context that is configured for VLAN B. Addresses that trigger blocks on VLAN A might refer to a different host on VLAN B.

**Note**

---

Blocking is not supported on the FWSM on the admin context in multiple-context mode.

---

There are three types of blocks:

- Host block—Blocks all traffic from a given IP address.

To configure the IPS to initiate automatic host blocks when a signature is triggered, add the **Request Block Host** event action to a signature, or add it to events based on risk rating using the event action override policy. See [Configuring Event Action Overrides, page 39-13](#) and [Configuring Signatures, page 38-4](#).

- Connection block—Blocks traffic from a given source IP address to a given destination IP address and destination port. Multiple connection blocks from the same source IP address to either a different destination IP address or destination port automatically switch the block from a connection block to a host block.

To configure the IPS to initiate automatic connection blocks when a signature is triggered, add the **Request Block Connection** event action to a signature, or add it to events based on risk rating using the event action override policy.

- Network block—Blocks all traffic from a given network.

You can initiate host and connection blocks manually or automatically when a signature is triggered. You can only initiate network blocks manually. You cannot initiate network blocks from within Security Manager; use the IPS Device Manager instead.

**Tip**

---

Connection blocks and network blocks are not supported on security appliances (firewalls). Security appliances only support host blocks with additional connection information.

---

**Note**

---

Do not confuse blocking with the ability of the sensor to drop packets. The sensor can drop packets when the following actions are configured for a sensor in inline mode: deny packet inline, deny connection inline, and deny attacker inline.

---

On Cisco IOS Software devices (routers and Catalyst 6500 series switches), ARC creates blocks by applying ACLs; on Catalyst 6500/7600 devices that run the Catalyst operating system, ARC creates blocks by applying VACLs. ACLs and VACLs permit or deny passage of data packets through interface directions or VLANs. Each ACL or VACL contains permit and deny conditions that apply to IP addresses. The security appliances use the **shun** command instead of ACLs.

**Tip**

For a list of the specific devices and operating system versions that you can configure as blocking devices, see the supported device information in the chapter “Configuring Attack Response Controller for Blocking and Rate Limiting” in the *Installing and Using Cisco Intrusion Prevention System Device Manager* publication for your IPS software version. These publications are available on Cisco.com at [http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/products_installation_and_configuration_guides_list.html).

The following topics explain more about IPS blocking:

- [Strategies for Applying Blocks, page 42-3](#)
- [Understanding Rate Limiting, page 42-4](#)
- [Understanding Router and Switch Blocking Devices, page 42-4](#)
- [Understanding the Master Blocking Sensor, page 42-6](#)
- [Configuring IPS Blocking and Rate Limiting, page 42-7](#)
- [Blocking Page, page 42-8](#)

## Strategies for Applying Blocks

Blocking is performed only when an event occurs and the event includes the Request Block Connection or Request Block Host event actions. These event actions are not typically needed when you operate the IPS in inline mode, where you use Deny actions to drop undesired traffic.

The following are situations in which you might want to implement blocking actions:

- Promiscuous mode—When running in promiscuous mode, the IPS cannot implement Deny actions. Thus, if you want to prevent traffic from a host, you must implement blocking.
- Inline mode—In inline mode, you can implement Deny actions to immediately drop undesired traffic. However, you might want to add blocking actions to protect other segments of your network.

For example, suppose that your network consists of five subnets, A, B, C, D, and E, and that each of these segments has an inline IPS device monitoring it. If the IPS for subnet A identifies an attack, the IPS can use Deny actions to protect subnet A, but also use Request Block actions to configure the firewalls that protect B, C, D, and E to shun the attacker before the attack can target those other subnets. In this example, you would want to designate a single IPS as the master blocking sensor and have the other four IPS sensors perform blocking through the master blocking sensor.

Use the following techniques to add the request block actions to an event:

- Event Action Override policy—Configure an event action override rule to add the action to all events based on the event’s risk rating. This is a simple approach. You could add the request block action for the same risk ratings used for adding Deny actions. For more information, see [Configuring Event Action Overrides, page 39-13](#).

- Signatures policy—You can add the request block actions to individual signatures. This requires editing each signature to add the action. This can be a time-consuming approach, but it allows you to configure blocking for just the types of events that concern you most. For more information, see [Configuring Signatures, page 38-4](#).

- [Blocking Page, page 42-8](#)

## Understanding Rate Limiting

Attack Response Controller (ARC) is responsible for rate limiting traffic in protected networks. Rate limiting lets sensors restrict the rate of specified traffic classes on network devices. Rate limit responses are supported for the Host Flood and Net Flood engines, and the TCP half-open SYN signature. ARC can configure rate limits on network devices running Cisco IOS 12.3 or later. Master blocking sensors can also forward rate limit requests to blocking forwarding sensors.

To add a rate limit to a signature, you must add the Request Rate Limit action. You can then edit the signature parameters to set the percentage for these signatures in the Event Actions Settings folder.

#### Tip

You can also manually implement rate limits, but you cannot do so using Security Manager; use the IPS Device Manager instead.

On the blocking device, you must not apply a service policy to an interface/direction that is configured for rate limiting. If you do so, the rate limit action will fail. Before configuring rate limits, confirm that there is no service policy on the interface/direction, and remove it if one exists. ARC does not remove the existing rate limit unless it is one that ARC had previously added.

Rate limits use ACLs, but not in the same way as blocks. Rate limits use ACLs and class-map entries to identify traffic, and policy-map and service-policy entries to police the traffic.

## Understanding Router and Switch Blocking Devices

You can use routers or Catalyst 6500/7600 devices running Cisco IOS Software, or Catalyst 6500/7600 devices running the Catalyst operating system, to implement IPS blocking in your network. When you use routers or switches, Attack Response Controller (ARC) configures extended ACLs (on IOS devices) or VLAN ACLs (on Catalyst OS devices) to implement the blocks. These ACLs and VACLs are created and managed in the same way.

Rate limits also use ACLs, but not in the same way as blocks. Rate limits use ACLs and class-map entries to identify traffic, and policy-map and service-policy entries to police the traffic.

#### Tip

IPS considers Catalyst 6500/7600 devices that run Cisco IOS Software to be equivalent to routers. When you add these devices as blocking devices, add them as routers.

When you configure a router interface or switch VLAN as a blocking interface, you can optionally specify the names of pre- and post-ACLs or VACLs. Although specifying ACL or VACL names is optional, if you have configured ACLs or VACLs on the interface or VLAN, you must identify them to the IPS or ARC will remove them from your device configuration.

The pre- and post-ACL/VACL have the following uses:

- The Pre-Block ACL/VACL is mainly used for permitting what you do not want the sensor to ever block. When a packet is checked against the ACL/VACL, the first line that gets matched determines the action. If the first line matched is a permit line from the Pre-Block ACL/VACL, the packet is permitted even though there may be a deny line (from an automatic block) listed later in the ACL/VACL. The Pre-Block ACL/VACL can override the deny lines resulting from the blocks.
- The Post-Block ACL/VACL is best used for additional blocking or permitting that you want to occur on the same interface or direction. If you have an existing ACL on the interface or direction that the sensor will manage, that existing ACL can be used as a Post-Block ACL/VACL. If you do not have a Post-Block ACL/VACL, the sensor inserts permit ip any any at the end of the new ACL/VACL.

If you are managing the IOS Software blocking device in Security Manager, you can identify the ACL name by selecting the blocking device, then selecting **Tools > Preview Config**. Look for the **ip access-group** command in the interface configuration, and check the direction. For example, the following lines show that there is an ACL named CSM\_FW\_ACL\_GigabitEthernet0/1 in the In direction attached to the GigabitEthernet0/1 interface.

```
interface GigabitEthernet0/1
 ip access-group CSM_FW_ACL_GigabitEthernet0/1 in
```

In this example, if you configure GigabitEthernet0/1 in the In direction as a blocking interface, ensure that you specify CSM\_FW\_ACL\_GigabitEthernet0/1 as a pre- or post-ACL. In most cases, you should specify the ACL as the post-ACL, so that the relatively short IPS blocking ACL first filters out undesirable traffic before the blocking device implements your other access rules.

Because Security Manager does not manage Catalyst OS devices, you must examine a Catalyst OS device configuration outside of Security Manager to determine VACL names. Keep in mind that a Catalyst 6500/7600 device that runs IOS Software can also have VACLs, but the IPS does not do VLAN blocking on Catalyst 6500/7600 VLANs when the device is running IOS Software.

When the sensor starts up, it reads the contents of the two ACL/VACLs. It creates a third ACL/VACL with the following entries in this order, and this combined ACL/VACL is applied to the interface or VLAN:

1. A **permit** line with the sensor IP address or, if specified, the NAT address of the sensor.

If you select the Allow Sensor IP address to be Blocked option on the General tab of the Blocking policy, this permit entry is not added. For more information, see [General Tab, IPS Blocking Policy, page 42-10](#).

2. Pre-Block ACL/VACL, if specified.
3. Any active blocks generated by the IPS (deny statements).
4. The Post-Block ACL/VACL, if specified.

If you do not specify a Post-Block ACL/VACL, a **permit ip any any** entry is added to allow all unfiltered traffic. Note that this negates the normal implicit deny any that ends interface ACLs.

When using Catalyst OS, IDSM-2 inserts **permit ip any any capture** at the end of the new VACL.

If ARC is managing a device and you need to configure the ACL/VACLs on that device, you should disable blocking first. You want to avoid a situation in which both you and ARC could be making a change at the same time on the same device. This could cause the device or ARC to fail. If you need to modify the Pre-Block or Post-Block ACL/VACL, do the following:

1. Disable blocking on the sensor.

Because you are making a temporary change, you can disable and then reenabling blocking by using the IPS Device Manager (IDM) on the device. Alternatively, you can deselect the Enable Blocking option on the General tab of the Blocking policy in Security Manager, then deploy the configuration to the IPS sensor. To reenabling blocking, select the Enable Blocking option again and deploy the configuration to the IPS sensor.

2. Make the changes to the configuration of the device. For example, if you manage the blocking device in Security Manager, deploy the updated configuration and wait for the device to reload.
3. Reenable blocking on the sensor.

## Understanding the Master Blocking Sensor

Multiple sensors (blocking forwarding sensors) can forward blocking requests to a specified master blocking sensor, which controls one or more devices. The master blocking sensor is the ARC running on a sensor that controls blocking on one or more devices on behalf of one or more other sensors. When a signature fires that has blocking or rate limit requests configured as event actions, the sensor forwards the block or rate limit request to the master blocking sensor, which then performs the block or rate limit.

When you add a master blocking sensor, you reduce the number of blocking devices per sensor. For example, if you want to block on 10 firewalls and 10 routers with one blocking interface/direction each, you can assign 10 to the sensor and assign the other 10 to a master blocking sensor.

You configure master blocking sensors on the Master Blocking Sensors tab of the Blocking policy, as described in [Blocking Page, page 42-8](#).

When configuring master blocking sensors, keep the following tips in mind:

- Two sensors cannot control blocking or rate limiting on the same device. If this situation is needed, configure one sensor as the master blocking sensor to manage the devices and the other sensors can forward their requests to the master blocking sensor.
- On the blocking forwarding sensor, identify which remote host serves as the master blocking sensor; on the master blocking sensor you must add the blocking forwarding sensors to its access list using the Allowed Hosts policy. See [Identifying Allowed Hosts, page 35-7](#).
- If the master blocking sensor requires TLS for web connections, you must configure the ARC of the blocking forwarding sensor to accept the X.509 certificate of the master blocking sensor remote host. Sensors by default have TLS enabled, but you can change this option. For more information, see [Master Blocking Sensor Dialog Box, page 42-13](#).
- Typically the master blocking sensor is configured to manage the network devices. Blocking forwarding sensors are not normally configured to manage other network devices, although doing so is permissible.
- Only one sensor should control all blocking interfaces on a device.

# Configuring IPS Blocking and Rate Limiting

If you use the Request Block Host, Request Block Connection, or Request Rate Limit actions on any signatures, or add them to events using the event action override policy, you must configure blocking devices. If you do not use these actions, there is no need to configure blocking devices.

Before you configure blocking, read the following topics:

- [Understanding IPS Blocking, page 42-1](#)
- [Strategies for Applying Blocks, page 42-3](#)
- [Understanding Rate Limiting, page 42-4](#)
- [Understanding Router and Switch Blocking Devices, page 42-4](#)
- [Understanding the Master Blocking Sensor, page 42-6](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Security > Blocking** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one.
- For an overview of the blocking policy, see [Blocking Page, page 42-8](#).
- Step 2** On the General tab, change any settings where you want non-default values. However, the default values are appropriate for most networks. For detailed information about the settings, see [General Tab, IPS Blocking Policy, page 42-10](#).
- Step 3** Click the **User Profiles** tab and create the user profiles that are required to log into the blocking devices.
- To add a profile, click the **Add Row** button and fill in the Add User Profile dialog box (see [User Profile Dialog Box, page 42-12](#)).
  - To edit a profile, select it and click the **Edit Row** button.
  - To delete a profile, select it and click the **Delete Row** button. Before you delete a profile, ensure that it is not currently being used by a blocking device.
- Step 4** If you need to use a master blocking sensor, as described in [Understanding the Master Blocking Sensor, page 42-6](#), click the **Master Blocking Sensors** tab and do the following:
- To add a master blocking sensor, click the **Add Row** button and fill in the Add Master Blocking Sensor dialog box (see [Master Blocking Sensor Dialog Box, page 42-13](#)).
  - To edit a master blocking sensor, select it and click the **Edit Row** button.
  - To delete a master blocking sensor, select it and click the **Delete Row** button.
- Step 5** Identify the blocking devices (unless you will use master blocking sensors only). You must add the devices to the correct tab:
- **Routers** tab—For all Cisco IOS Software devices, including Catalyst 6500 switches that are running IOS Software.
  - **Firewalls** tab—For ASA, PIX, and FWSM.
  - **Catalyst 6K** tab—For Catalyst 6500/7600 devices that are running the Catalyst operating system.
- On each tab, the configuration steps are the same:
- To add a device, click the **Add Row** button and fill in the Add Router, Firewall, or Cat6K Device dialog box (see [Router, Firewall, Cat6K Device Dialog Box, page 42-14](#)).

- To edit a device, select it and click the **Edit Row** button.
- To delete a device, select it and click the **Delete Row** button.

**Step 6** Click the **Never Block Hosts and Networks** tab and identify the hosts and networks that should never be blocked. These lists affect blocking actions, but they do not affect limiting actions. Identify your trusted networks and hosts:

- To add a host or network, click the **Add Row** button beneath the appropriate table and fill in the Add Never Block Host or Network dialog box (see [Never Block Host or Network Dialog Boxes](#), page 42-17).
- To edit a host or network, select it and click the **Edit Row** button.
- To delete a host or network, select it and click the **Delete Row** button.

## Blocking Page

Use the Blocking page to configure IPS sensor blocking properties. Configure the blocking policy only if you use the Request Block Connection, Request Block Host, or Request Rate Limit event actions in your signatures or event actions policies. Blocking hosts are used only for events to which these actions are assigned.

**Tip**

The list of hosts and networks to never block applies only to the Request Block Connection and Request Block Host event actions. The list does not affect rate limiting, nor does it affect any of the Deny actions such as Deny Packet Inline. To exempt hosts and networks from Deny or rate limiting actions, use event action filter rules, specify the hosts and networks as Attackers, and remove the actions from events. For more information, see [Configuring Event Action Filters](#), page 39-4.

### Navigation Path

- (Device view) Select **Platform > Security > Blocking** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one.

| Firewall tab                   | <p>The ASA, PIX, and FWSM devices to be used as blocking devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), and the name of the profile that is used for logging into the device.</p> <ul style="list-style-type: none"> <li>To add a firewall, click the <b>Add Row</b> button and fill in the Add Firewall Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box</a>, page 42-14).</li> <li>To edit a firewall, select it and click the <b>Edit Row</b> button.</li> <li>To delete a firewall, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                                            |
| Catalyst 6K tab                | <p>The Catalyst 6500/7600 devices that are using Catalyst software to be used as blocking devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), and the name of the profile that is used for logging into the device.</p> <p><b>Tip</b> Do not use this tab for Catalyst 6500/7600 devices that run Cisco IOS Software. Instead, use the Router tab.</p> <ul style="list-style-type: none"> <li>To add a Catalyst OS device, click the <b>Add Row</b> button and fill in the Add Cat6K Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box</a>, page 42-14).</li> <li>To edit a Catalyst OS device, select it and click the <b>Edit Row</b> button.</li> <li>To delete a Catalyst OS device, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Never Block Hosts and Networks | <p>The hosts and networks that should never be blocked. Hosts and networks are shown in separate tables. The tables show the IP address or network/host object for the host or network. These lists do not affect rate limiting actions, nor do they apply to Deny actions.</p> <ul style="list-style-type: none"> <li>To add a host or network, click the <b>Add Row</b> button beneath the appropriate table and fill in the Add Never Block Host or Network dialog box (see <a href="#">Never Block Host or Network Dialog Boxes</a>, page 42-17).</li> <li>To edit a host or network, select it and click the <b>Edit Row</b> button.</li> <li>To delete a host or network, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                           |

## General Tab, IPS Blocking Policy

Use the General tab of the Blocking policy to configure the basic settings required to enable blocking and rate limiting.

**Navigation Path**

- (Device view) Select **Platform > Security > Blocking** from the Policy selector. If necessary, select the **General** tab.
- (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one. If necessary, select the **General** tab.

**Field Reference****Table 42-2** *General Tab, IPS Blocking Policy*

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log All Block Events and Errors       | <p>Whether to log events that follow blocks from start to finish and any error messages that occur. When a block is added to or removed from a device, an event is logged. You may not want all these events and errors to be logged. Disabling this option suppresses new events and errors. The default is enabled.</p> <p><b>Note</b> Log all block events and errors also applies to rate limiting.</p>                                                                                                                                                                                                                                                   |
| Enable NVRAM Write                    | <p>Whether to have the router write to non-volatile RAM (NVRAM) when Attack Response Controller (ARC) first connects. If enabled, NVRAM is written each time the ACLs are updated. The default is disabled.</p> <p>Enabling NVRAM writing ensures that all changes for blocking and rate limiting are written to NVRAM. If the router is rebooted, the correct blocks and rate limits will still be active. If NVRAM writing is disabled, a short time without blocking or rate limiting occurs after a router reboot. Not enabling NVRAM writing increases the life of the NVRAM and decreases the time for new blocks and rate limits to be configured.</p> |
| Enable ACL Logging                    | <p>Whether to have ARC append the log parameter to block entries in the access control list (ACL) or VLAN ACL (VACL). This causes the device to generate syslog events when packets are filtered. This option applies to routers and switches only. The default is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                              |
| Allow Sensor IP address to be Blocked | <p>Whether the sensor IP address can be blocked. The default is disabled.</p> <p><b>Tip</b> If you allow the sensor address to be blocked, the IPS does not add an explicit permit entry to the interface ACL to allow the IPS address. You must ensure that the IPS address is permitted by the device ACL or the IPS cannot implement blocking on the device.</p>                                                                                                                                                                                                                                                                                           |
| Enable Blocking                       | <p>Whether to enable the blocking and rate limiting of hosts. The default is enabled.</p> <p><b>Note</b> When you enable blocking, you also enable rate limiting. When you disable blocking, you also disable rate limiting. This means that ARC cannot add new or remove existing blocks or rate limits.</p>                                                                                                                                                                                                                                                                                                                                                 |

Table 42-2 General Tab, IPS Blocking Policy (Continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Blocks      | The maximum number of entries to block. The range is 1 to 65535. The default is 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Max Interfaces  | <p>The maximum number of interfaces for performing blocks. For example, a PIX 500 series security appliance counts as one interface. A router with one interface counts as one, but a router with two interfaces counts as two. The maximum number of interfaces is 250 per device. The default is 250.</p> <p>You use Max Interfaces to set an upper limit on the number of devices and interfaces that ARC can manage. The total number of blocking devices (not including master blocking sensors) cannot exceed this value. The total number of blocking items also cannot exceed this value, where a blocking item is one security appliance context, one router blocking interface/direction, or one Catalyst Software switch blocking VLAN.</p> <p><b>Note</b> In addition, the following maximum limits are fixed and you cannot change them: 100 interfaces per device, 250 security appliances, 250 routers, 250 Catalyst Software switches, and 100 master blocking sensors.</p> |
| Max Rate Limits | The maximum number of rate limit entries. The maximum rate limit must be equal to or less than the maximum blocking entries. The range is 1 to 32767. The default value is 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## User Profile Dialog Box

Use the Add or Modify User Profile dialog box to add or modify a user profile for an IPS blocking device. The profile defines a username and passwords that the IPS device can use to log into and configure the router, switch, or firewall that will implement IPS blocking.

Although you can save a profile that has a profile name only, the requirements for username, password, and enable password are determined by the device. You must specify the items required by the device to enter configuration mode, or the IPS cannot configure blocking on the device.

### Navigation Path

From the IPS Blocking policy, select the User Profiles tab and click the **Add Row** button or select an existing sensor and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page, page 42-8](#).

### Field Reference

Table 42-3 User Profile Dialog Box

| Element      | Description                                                |
|--------------|------------------------------------------------------------|
| Profile Name | The name of the profile, up to 64 alphanumeric characters. |
| Username     | The username to use when logging into the blocking device. |
| Password     | The login password for the username, if required.          |

**Table 42-3** *User Profile Dialog Box (Continued)*

| Element         | Description                                                                       |
|-----------------|-----------------------------------------------------------------------------------|
| Enable Password | The enable password for entering Privileged EXEC Mode (enable mode), if required. |

## Master Blocking Sensor Dialog Box

Use the Add or Modify Master Blocking Sensor dialog box to configure a master blocking sensor. For more information about master blocking sensors, see [Understanding the Master Blocking Sensor](#), page 42-6.

### Navigation Path

From the IPS Blocking policy, select the Master Blocking Sensors tab and click the **Add Row** button or select an existing sensor and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), page 42-8.

### Field Reference

**Table 42-4** *Master Blocking Sensor Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | The IP address of the master blocking sensor. Enter the IP address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Username   | The username to use to log in to the master blocking sensor. The user account must be an active account configured on the master blocking sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Password   | The login password for the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Port       | The port on which to connect on the master blocking sensor. The default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TLS        | Whether to use TLS.<br><br>If you select the TLS option, you must configure the ARC of the blocking forwarding sensor to accept the TLS/SSL X.509 certificate of the master blocking sensor remote host. (The blocking forwarding sensor is any device to which you are assigning this blocking policy.)<br><br>The easiest way to configure the blocking forwarding sensor to accept the X.509 certificate is to use the IPS Device Manager (IDM) to log into the sensor, choose <b>Configuration &gt; Sensor Management &gt; Certificates &gt; Trusted Hosts &gt; Add Trusted Host</b> , and add the master blocking sensor as a trusted host. Alternatively, you can log into the sensor CLI, enter configuration mode, and use the <b>tls trusted-host ip-address</b> command. |

## Router, Firewall, Cat6K Device Dialog Box

Use the Add or Modify Router, Firewall, or Cat6K Device dialog box to configure a device as a blocking device for an IPS sensor. The name of the dialog box indicates the type of device you are adding:

- Router—IOS Software routers and Catalyst 6500/7600 devices. These devices can do rate limiting as well as blocking. See [Understanding Router and Switch Blocking Devices](#), page 42-4.
- Firewall—ASA and PIX appliances.
- Cat6K—Catalyst 6500/7600 devices that are running Catalyst OS software.

### Tip

If the Catalyst 6500/7600 runs Cisco IOS Software, add the device as a router on the Router tab. Do not add the device to the Cat6K tab.

### Navigation Path

From the IPS Blocking policy, select the Router, Firewall, or Catalyst 6K tab and click the **Add Row** button or select an existing row and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), page 42-8.

### Field Reference

**Table 42-5 Router, Firewall, Cat6K Device Dialog Boxes**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address         | The IP address of the device. Enter the IP address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                       |
| Communication Type | The communication mechanism used to log in to the blocking device (SSH 3DES, SSH DES, Telnet). The default is SSH 3DES.<br><br>If you choose SSH 3DES or SSH DES, you must add the device to the known hosts list. The easiest way to add the device to the known hosts list is to use the IPS Device Manager (IDM) to log into the sensor, choose <b>Configuration &gt; Sensor Management &gt; SSH &gt; Known Host Keys &gt; Add Known Host Key</b> , and add the device address.<br>Alternatively, you can log into the sensor CLI, enter configuration mode, and use the <b>ssh host-key</b> command. |
| NAT Address        | The NAT address of the sensor, if any is used between the sensor and the blocking device. Enter the NAT address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one. Leave the default 0.0.0.0 if NAT is not used.                                                                                                                                                                                                                                                                            |
| Profile Name       | The login profile used to log in to the blocking device. You must create this profile on the User Profiles tab of the blocking policy or the IPS cannot successfully use this blocking device.                                                                                                                                                                                                                                                                                                                                                                                                           |

| Element                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces and directions where blocks will be applied (table)<br>(Routers only.)                                      | <p>The interfaces on the device that should be used for blocking or rate limiting. The table shows the interface name, direction, and the names of existing ACLs that the IPS device should incorporate into the blocking ACL.</p> <p>If the interface already has an ACL configured for the specified direction, you must specify that ACL name as a pre- or post-ACL or the IPS removes the ACL. These ACLs are used for blocking only, not for rate limiting.</p> <ul style="list-style-type: none"> <li>To add an interface, click the <b>Add Row</b> button and fill in the Add Router Block Interface dialog box (see <a href="#">Router Block Interface Dialog Box, page 42-15</a>).</li> <li>To edit an interface, select it and click the <b>Edit Row</b> button.</li> <li>To delete an interface, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Response Capabilities<br>(Routers only.)                                                                               | <p>The actions that this router can implement. Use Ctrl+click to select multiple actions (highlighted actions are selected). Options are:</p> <ul style="list-style-type: none"> <li><b>Block</b>—The router can implement blocks in response to Request Block Connection and Request Block Host actions.</li> <li><b>Rate Limit</b>—The router can implement rate limits in response to Request Rate Limit actions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| VLANs where blocks will be applied (table)<br>(Catalyst 6500/7600 devices running the Catalyst operating system only.) | <p>The VLANs on the device that should be used for blocking. The table shows the VLAN name and the names of existing VLAN ACLs (VACL) that the IPS device should incorporate into the blocking VACL.</p> <p>If the VLAN already has a VACL configured, you must specify that VACL name as a pre- or post-VACL or the IPS removes the VACL.</p> <ul style="list-style-type: none"> <li>To add a VLAN, click the <b>Add Row</b> button and fill in the Add Cat6K Block VLAN dialog box (see <a href="#">Cat6k Block VLAN Dialog Box, page 42-16</a>).</li> <li>To edit a VLAN, select it and click the <b>Edit Row</b> button.</li> <li>To delete a VLAN, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                     |

## Router Block Interface Dialog Box

Use the Add or Modify Router Block Interface dialog box to configure a blocking interface on a router or IOS Software Catalyst 6500/7600 device that is configured as an IPS blocking device. The IPS sensor uses the interface for blocking actions.

### Navigation Path

From the Add or Modify Router Device dialog box, click the **Add Row** button beneath the interfaces table, or select a row in the table and click the **Edit Row** button. For information on opening the Router Device dialog box, see [Router, Firewall, Cat6K Device Dialog Box, page 42-14](#).

## Field Reference

Table 42-6 Router Block Interface Dialog Box

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                | The name of the interface on the router that the IPS should use for blocking. Enter the name exactly as it is configured on the router (for example, GigabitEthernet0/1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Direction                     | The direction to apply the blocking ACL, In or Out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Pre ACL Name<br>Post ACL Name | <p>The ACLs to combine with the blocking entries that the IPS creates to implement blocking actions. The Pre ACL is added before the blocking ACL, and the Post ACL is added after the blocking ACL. For more information, see <a href="#">Understanding Router and Switch Blocking Devices</a>, page 42-4.</p> <p><b>Tip</b> If you have configured an ACL on the interface in the specified direction, you must specify the name of the ACL in the Pre or Post ACL Name field or the ACL will be removed from the interface. When you identify an interface and direction as a blocking interface, the IPS takes control of the ACL on that interface/direction.</p> <p>If you are managing the blocking device in Security Manager, you can identify the ACL name by selecting the blocking device, then selecting <b>Tools &gt; Preview Config</b>. Look for the <b>ip access-group</b> command in the interface configuration, and check the direction. For example, the following lines show that there is an ACL named CSM_FW_ACL_GigabitEthernet0/1 in the In direction attached to the GigabitEthernet0/1 interface.</p> <pre>interface GigabitEthernet0/1  ip access-group CSM_FW_ACL_GigabitEthernet0/1 in</pre> <p>In this example, if you configure GigabitEthernet0/1 in the In direction as a blocking interface, ensure that you specify CSM_FW_ACL_GigabitEthernet0/1 as a pre- or post-ACL. In most cases, you should specify the ACL as the post-ACL, so that the relatively short IPS blocking ACL first filters out undesirable traffic before the blocking device implements your other access rules.</p> |

## Cat6k Block VLAN Dialog Box

Use the Add or Modify Cat6k Block VLAN dialog box to configure a blocking VLAN on a Catalyst 6500/7600 device that runs the Catalyst operating system and that is configured as an IPS blocking device. The IPS sensor uses the VLAN for blocking actions.

**Tip**

If the Catalyst 6500/7600 runs Cisco IOS Software, add the device as a router, not a Cat6K.

**Navigation Path**

From the Add or Modify Cat6K Device dialog box, click the **Add Row** button beneath the VLANs table, or select a row in the table and click the **Edit Row** button. For information on opening the Cat6K Device dialog box, see [Router, Firewall, Cat6K Device Dialog Box](#), page 42-14.

**Field Reference****Table 42-7** *Cat6k Block VLAN Dialog Box*

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN                            | The number of the VLAN on the Catalyst 6500/7600 device that the IPS should use for blocking. The number can be 1 to 4094 and must be defined on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Pre VACL Name<br>Post VACL Name | The VLAN ACLs to combine with the blocking entries that the IPS creates to implement blocking actions. The Pre VACL is added before the blocking VACL, and the Post VACL is added after the blocking VACL. For more information, see <a href="#">Understanding Router and Switch Blocking Devices, page 42-4</a> .<br><br><b>Tip</b> If you have configured a VACL on the VLAN, you must specify the name of the VACL in the Pre or Post VACL Name field or the VACL will be removed from the VLAN. When you identify a VLAN as a blocking interface, the IPS takes control of the VACL on that VLAN. Typically, you would specify the VACL name as the post-VACL. |

## Never Block Host or Network Dialog Boxes

Use the Add or Modify Never Block Host or Network dialog boxes to specify a host or network that should never be subject to blocking. The name of the dialog box indicates whether you are adding a host or network address.

Enter the IP address or the name of a network/host policy object that specifies the address. You can also click **Select** to select an object from a list or to create a new object. When selecting objects, the object can contain a single entry of the appropriate type. Host addresses do not have subnet masks (for example, 10.100.10.1), whereas network addresses have masks (for example, 10.100.10.0/24).

**Navigation Path**

From the IPS Blocking policy, select the Never Block Hosts or Networks tab and click the **Add Row** button or select an existing row and click the **Edit Row** button. Hosts and networks are listed in separate tables, so ensure that you click the buttons associated with the desired table. For information on opening the Blocking policy, see [Blocking Page, page 42-8](#).

## CHAPTER 43

# Managing IPS Sensors

---

To perform day-to-day sensor management, you typically need to use a device manager such as the IPS Device Manager (IDM). Security Manager is focused on policy and event management.

However, the following topics describe some management activities that you can perform using Security Manager:

- [Managing IPS Licenses, page 43-1](#)
- [Managing IPS Updates, page 43-4](#)
- [Managing IPS Certificates, page 43-10](#)
- [Rebooting IPS Sensors, page 43-11](#)

## Managing IPS Licenses

The following topics explain how to manage licenses for IPS devices:

- [Updating IPS License Files, page 43-1](#)
- [Redeploying IPS License Files, page 43-2](#)
- [Automating IPS License File Updates, page 43-3](#)

## Updating IPS License Files

You can use Security Manager to update the licenses for IPS devices. This procedure explains how to update the licenses manually by retrieving them from Cisco.com or from a license file on the Security Manager server. For information about setting up automatic license updates, see [Automating IPS License File Updates, page 43-3](#).

### Before You Begin

If you use Cisco.com, you must first configure the IPS Update server to be Cisco.com, so that you can specify the username and password. You must use Cisco.com for licensing if you are using a device that requires it; for example, an IPS 4270 or an AIP SSM-40 in an ASA device requires a Cisco.com account. For information on configuring Cisco.com as the IPS Update server, see [Configuring the IPS Update Server, page 43-4](#).

If you use local licenses, you must download them directly to the Security Manager server file system. You cannot do this through Security Manager; you must log into Windows on the server to download the licenses.

**Related Topics**

- [Redeploying IPS License Files, page 43-2](#)

---

**Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page, page 11-41](#)).

The table lists all IPS devices in the device inventory and displays the status of their licenses. The status can be valid, invalid, expired, no license, or trial license. The expiration date for the license is also shown. Click **Refresh License** to update the table with the latest license information from the devices (you can select one or more devices to limit the scope of the refresh).

To update licenses, do one of the following:

- To update devices with licenses obtained directly from Cisco.com—Select the devices you want to update and click **Update Selected via CCO**. A dialog box opens that lists the devices that can be updated from Cisco.com, which might not be all of the devices you selected. Review the list and click **OK**. The status of the update task is shown in the License Update Status Details dialog box (see [License Update Status Details Dialog Box, page 11-43](#)).

To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.

**Tip**

---

The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.

---

- To update devices with licenses that you have copied to the Security Manager server—Click **Update from License File**. A dialog box opens where you can select the license files. Click **Browse** to select them from the Security Manager local file system. You can select more than one license file. When you have selected the desired files, click **OK** to have them applied to the devices.
- 

## Redeploying IPS License Files

If an attempt to apply an IPS license update to a device fails, you can redeploy the update. Redeployment works only if you have already attempted to apply an update and a license file is associated with the IPS device.

**Related Topics**

- [Updating IPS License Files, page 43-1](#)
- [Automating IPS License File Updates, page 43-3](#)

---

**Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page, page 11-41](#)).

**Step 3** Select the devices to which you want to redeploy licenses and click **Redeploy Selected Licenses**. A dialog box opens listing devices whose licenses you are redeploying. Click **OK** to perform the update.

The status of the update task is shown in the License Update Status Details dialog box (see [License Update Status Details Dialog Box, page 11-43](#)).

---

## Automating IPS License File Updates

Security Manager can automatically apply IPS license updates to your IPS devices on a regular schedule. To successfully configure automatic updates, you must have a Cisco.com support contract that includes the serial numbers of your IPS devices.

Tip

Security Manager applies new licenses only if the downloaded license has an expiration date further into the future than the one replaced or if the license information is different.

---

### Before You Begin

You must first configure the IPS Update server to be Cisco.com, so that you can specify the Cisco.com username and password. For information on configuring Cisco.com as the IPS Update server, see [Configuring the IPS Update Server, page 43-4](#).

### Related Topics

- [Updating IPS License Files, page 43-1](#)
- [Redeploying IPS License Files, page 43-2](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.
- Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page, page 11-41](#)).
- Step 3** Select **Download and apply licenses** and configure the following settings:
- **Days before the expiration date**—Select the number of days before a license expires that Security Manager should download an updated license. The default is 1 day.
  - **Discover devices daily at**—Select the time of day when Security Manager should download licenses. At this time, Security Manager will check the license status on the devices, and contact Cisco.com for new licenses for devices that have no license, have expired licenses, or that have licenses that will expire within the number of days you selected.
  - **Email License Update Results**—Select whether Security Manager should send e-mail notification of license update results. E-mails are sent with license expiration status and for license update job results. If you select this option, enter one or more e-mail addresses in the **Email Notification** field. Separate multiple addresses with commas.
- For the e-mails to be sent, you must configure an SMTP server as described in [Configuring an SMTP Server and Default Addresses for E-Mail Notifications, page 1-25](#).
- Step 4** Click **Save** to save your changes.
-

# Managing IPS Updates

You can use Security Manager to apply sensor and signature updates to your IPS devices and shared policies. Through Security Manager, you can download updates and either set up automatic updates or apply them manually.

Signature updates are available only for IPS 5.1(4) and higher.

**Tip**

If you have problems applying patches, service packs, or signature updates, check the time on your IPS sensor. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected and the update may fail. Use the Network Time Protocol (NTP) to maintain accurate time on an IPS sensor. For information on configuring NTP on the sensor, see [Identifying an NTP Server, page 35-21](#).

The IPS packages included with Security Manager do not include the package files that are required for updating IPS devices. You must download IPS packages from Cisco.com or your local update server before you can apply any updates. The downloaded versions include all required package files and replace the partial files that are included in the Security Manager initial installation.

The following topics describe how to use Security Manager to manage IPS updates:

- [Configuring the IPS Update Server, page 43-4](#)
- [Checking for IPS Updates and Downloading Them, page 43-5](#)
- [Automating IPS Updates, page 43-6](#)
- [Manually Applying IPS Updates, page 43-7](#)

## Configuring the IPS Update Server

To apply IPS sensor and signature updates, Security Manager must download the updates to the Security Manager server from an identified IPS Update server.

You can use Cisco.com as the IPS Update server. Using Cisco.com ensures that the latest updates are available to you at their earliest availability. However, if you cannot use Cisco.com for some reason, you can set up your own local IPS Update web server, manually download updates to it, and configure Security Manager to obtain the updates from your local server.

**Tip**

If you are using a device that requires a Cisco.com login for updating licenses, such as an IPS 4270 or an AIP SSM-40 in an ASA device, you must configure the IPS Update server as Cisco.com. You cannot use a local server.

**Related Topics**

- [Automating IPS Updates, page 43-6](#)
- [Manually Applying IPS Updates, page 43-7](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page, page 11-30](#)).
- Step 2** In the Update Server area, click **Edit Settings** to open the Edit Update Server Settings dialog box (see [Edit Update Server Settings Dialog Box, page 11-34](#)).

- Step 3** Enter the identifying information for your server. Based on the server type selected in the Update From field:
- Cisco.com—Enter a Cisco.com username and password. The user account you specify must have applied for eligibility to download strong encryption software. To verify the account has the appropriate permissions, go to Cisco.com and try to download an IPS update package. You will be prompted to accept the appropriate agreements if the account is not already qualified.
  - Local server—Enter the IP address or DNS host name of your server, a username and password if you require a log in before allowing access, and the path to the folder that contains the files. For the path, do not enter the entire URL; enter only the path portion of the URL (for example, the path in http://servername/IPSPATH is IPSPATH). Also add IIS configuration settings:
    - Home Directory should have listing enabled.
    - Documents should have Default Content Page disabled.

Enter certificate information. Before you can download an IPS package, you must accept the Cisco.com certificate. You must accept the certificate from both the "Image Meta-data locator" site and the download site of the IPS packages to start downloading images successfully (see [Edit Update Server Settings Dialog Box](#), page 11-34).

If your network requires a proxy server to get from the Security Manager server to the IPS Update server, select **Enable Proxy Server** and enter the information for the proxy server.

Click **OK** to save your changes.

- Step 4** Click **Save** on the IPS Updates page. Your changes are not completely saved unless you click **Save**.

- Step 5** Test the connectivity to the IPS Update server by clicking **Download Latest Updates**. A dialog box opens. Click **Start** to have Security Manager log into the update server, check for new updates, and download them. The dialog box displays the results of the operation.

If you are using Cisco.com and experience a download failure, double-check the user account to ensure it has the required permissions for downloading strong encryption software.

## Checking for IPS Updates and Downloading Them

You can use Security Manager to check for IPS sensor and signature updates and download them to the Security Manager server, where you can apply them to your IPS devices and policies.

You can manually download IPS updates, automate IPS update downloads, or download them when you try to manually apply them to a device. The following procedure explains how to manually check for updates and download them. For information on configuring automatic downloads, see [Automating IPS Updates](#), page 43-6. For information on downloading updates while manually applying them to devices or policies, see [Manually Applying IPS Updates](#), page 43-7.

### Before You Begin

You must configure the IPS Update server as described in [Configuring the IPS Update Server](#), page 43-4.

### Related Topics

- [Automating IPS Updates](#), page 43-6
- [Manually Applying IPS Updates](#), page 43-7

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page, page 11-30](#)).
- Step 2** Review the status information in the Update Status group, and do any of the following:
- Click **Check for Updates**. A dialog box opens to display the results of the operation. Click **Start** to have Security Manager log into the IPS Update server and check for updates.
  - Click **Download Latest Updates**. A dialog box opens to display the results of the operation. Click **Start** to have Security Manager log into the IPS Update server, check for updates, and download them to the Security Manager server.

**Tip** If a Cisco.com download fails, ensure that the account you are using has applied for eligibility to download strong encryption software. For details, see the description of User Name in [Edit Update Server Settings Dialog Box, page 11-34](#).

---

## Automating IPS Updates

You can automatically apply sensor image and signature updates to compatible IPS devices to ensure that they are up to date. If desired, you can partially automate the updates to maintain the desired level of control over the process.

**Tip** If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

---

**Tip** If you do not manage IPS devices, consider taking the following performance tuning step. In `$NMSROOT\MDC\ips\etc\sensorupdate.properties`, change the value of `packageMonitorInterval` from its initial default value of 30,000 milliseconds to a less-frequent value of 600,000 milliseconds. Taking this step will improve performance somewhat. [`$NMSROOT` is the full pathname of the Common Services installation directory (the default is `C:\Program Files\CSCOpX`).]

---

### Before You Begin

You must configure the IPS Update server as described in [Configuring the IPS Update Server, page 43-4](#).

### Related Topics

- [Checking for IPS Updates and Downloading Them, page 43-5](#)
- [Manually Applying IPS Updates, page 43-7](#)
- [Understanding IPS Network Sensing, page 35-1](#)
- [Deploying Configurations in Non-Workflow Mode, page 8-29](#)
- [Deploying Configurations in Workflow Mode, page 8-35](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page, page 11-30](#)).

- Step 2** In the Auto Update Settings group in the lower portion of the page, select an auto update mode to establish the extent of automation. Choices include:
- Download, Apply, and Deploy Updates—Security Manager checks for updates according to your schedule, downloads them to the Security Manager server, applies them to the selected devices and policies, and starts a deployment job to update the affected devices. This choice ensures that your devices are running the latest updates with minimal effort for your operations staff.
  - Disable Auto Update—Security Manager does not perform any automatic actions for IPS updates.
  - Check for Updates—Security Manager checks for updates according to your schedule and updates the information in the Update Status group. No devices or policies are updated.
  - Download Updates—Security Manager checks for updates according to your schedule and downloads any new updates to the Security Manager server.
  - Download and Apply Updates—Security Manager checks for updates according to your schedule, downloads them, and applies them to the selected devices and policies. You must separately create a deployment job to deploy the changes to the affected devices.
- Step 3** Click **Edit Update Schedule** to open a dialog box where you can specify the schedule for the operation. Select the starting date, enter the starting time in 24-hour format (hh:mm), and select whether the schedule should be by the hour, day, week, month, or a one-time event. Click **OK** to save the schedule.
- Step 4** (Optional) Enter an e-mail address in the Notify Email field. Security Manager will notify this user when a package is available for download or has been downloaded, applied, or deployed. You can enter more than one address by separating the addresses with commas.
- Step 5** Select the devices and shared policies you want to automatically update in the Apply Update To selector. Use the Type field to toggle between local policies (for devices) and shared policies.
- To select a device or policy, click it in the selector and click the **Edit Row** button (the pencil icon below the selector). This action opens the Edit Auto Update Settings dialog box. Select the types of updates you want to apply: minor sensor updates and service packs or service packs only, and the signature update level. Click **OK** to save your changes. The devices to which the policy apply are added to the Devices to be Auto Updated list. A message will indicate if you need to submit your changes for the change to take effect.
- Step 6** Click **Save**.
- 

## Manually Applying IPS Updates

You can manually apply image and signature updates to compatible IPS devices using the Apply IPS Update wizard. Use this procedure with policies and devices that you did not configure for automatic updates (as described in [Automating IPS Updates](#), page 43-6).

When applying signature updates, the wizard displays those signatures in the update that are not configured on the target IPS devices. You can configure the new signatures before they are applied.

When applying image and signature updates, only those devices to which the updates can be applied are available for selection. Inapplicable devices are grayed out. A device can be grayed out even if a signature update applies to it if the required engine upgrade or generic packages are not available.

### Tip

If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

---

**Before You Begin**

Configure the IPS Update server as described in [Configuring the IPS Update Server, page 43-4](#).

**Related Topics**

- [Checking for IPS Updates and Downloading Them, page 43-5](#)
- [Selecting a Signature Category for Cisco IOS IPS, page 44-6](#)

**Note**

This note describes a difference between the update packages for IPS 7.1.3 and those used for earlier versions. When you open the Apply IPS Update wizard (Tools > Apply IPS Update), the first page of the wizard lists the sensor and signature update packages that are available. Beginning with IPS 7.1.3, a single update package is used for all supported platforms, such as IPS-4270 and ASA-SSE-AIP-85; example: IPS-CSM-K9-7.1.3.zip. Prior to IPS 7.1.3, a separate package was used for each supported platform; example: IPS-CS-MGR-SSC\_5-K9-6.2-4-E4.zip.

- 
- Step 1** Select **Tools > Apply IPS Update** to open the Apply IPS Update wizard.
- Step 2** On the first page of the wizard, select the update that you want to apply. This page lists the sensor and signature updates that are available. Do the following on this page:
- To update the list of packages, click **Download Latest Updates**. Security Manager logs into the IPS Update server and downloads the updates that have become available since the last download. This works only if you have configured an update server as described in [Configuring the IPS Update Server, page 43-4](#). You can also update the list of packages by doing the following:
    - Configure automatic downloads on the IPS Updates page (select **Tools > Security Manager Administration > IPS Updates**). For more information, see [IPS Updates Page, page 11-30](#).
    - Manually download the updates to the CSCOpX\MDC\ips\updates folder in the product installation folder (typically Program Files) on the Security Manager server.
- You can also check for updates without downloading them by clicking **Check for Updates**. The Update Status information is the same as described in [IPS Updates Page, page 11-30](#).
- Select the signature or sensor update you want to apply to your IPS devices in the Updates Downloaded table. Use the **Type** field to toggle between the types of updates (you can select only one update to apply):
    - **Sensor Updates**—Displays the filename, the major, minor, service pack, and patch versions, as well as the supported engine release. You must apply all major sensor updates, however, minor updates are cumulative.
    - **Signature Updates**—Displays the filename, the signature number, and the supported engine release. Signature updates are cumulative; however, applying them as separate packages allows you to separate your work into more manageable units if you intend to tune the updates to match the specific needs of your network.

**Note**

The engine package is not listed on the update page, but Security Manager implicitly pushes the engine package automatically in the case of a signature update that requires a higher engine version. (This occurs only when updating a device with the particular version that the engine package requires.)

Click **Next** to continue.

**Step 3** On the second page of the wizard, select the local signature policies (representing devices not assigned to any shared signature policy) and shared signature policies you want to update from the Apply Updates To list. Use the **Type** field to toggle between the types of policies. You can select any combination of local and shared policies. When you select a policy, the devices that use the policy are selected for update.

To select all applicable devices or shared policies, click **Select All**. To erase your selection and start over, click **Deselect All**. These buttons apply only to the displayed list.

IPS devices to which the update does not apply are grayed out in the Apply Updates To list, and you cannot select them. When you select a device that can be updated, it is listed in the Devices Assigned to Selected Policies list; these are the only devices that will be updated. If you select a shared policy, all devices that are using the policy appear in the selected policies list, but the devices to which the update does not apply are grayed out.

**Tip** The engine release controls which devices you can select for sensor updates; you can apply the update only to devices that use the same engine version, regardless of the release version. For example, if your device is running 6.0(5) E3, you can update to 6.1(1) E3 but not to 6.1(1) E2. You also cannot apply a 6.1(1) E3 update to a device running 6.1(1) E2. If you want to update the engine version, select a signature update with the higher engine version, and Security Manager will update the engine level automatically while updating the signatures. For example, if the device has the 6.1(1) E2 version and needs to have the E3 engine package applied, choose the signature package that requires the E3 engine and apply it to the device; doing so applies the engine package automatically to the device while updating the signatures. Thus, if the device you want to update is grayed out, click **Back** and change your update selection.

If you are applying a signature update, and you want to edit the signatures before applying them, click **Next** to continue. Otherwise, click **Finish** to apply your update to the policies.

**Step 4** (Optional) On the third page of the wizard, modify the signatures as desired.

The signatures list displays the new and modified signatures between the signature level of the selected update and the lowest signature level among the selected devices. If the selected devices include both IPS sensors and Cisco IOS IPS devices, the signatures for these devices appear on separate tabs.

Click the link in the ID number to read the description for the signature on Cisco.com. The Status column indicates whether the signature is new or modified (see the visual description of the icons on the wizard page).

To edit a signature, select it in the table and click the Edit button below the table (the pencil icon). For help in understanding the signature, click **Help** in the dialog box that the Edit button opens.

For details on available signature information, see [Signatures Page, page 38-4](#). In the Signature Summary Table, you can also add custom signatures and delete signatures, but you cannot do that on this page of the Apply IPS Update Wizard.

Click **Finish** to apply your update to the policies and to save your edits.

**Step 5** Submit your changes and deploy them to the devices. For information on creating deployment jobs, see these topics:

- [Deploying Configurations in Non-Workflow Mode, page 8-29](#)
- [Deploying Configurations in Workflow Mode, page 8-35](#)

# Managing IPS Certificates

When you configure Security Manager to use SSL (HTTPS) to communicate with your IPS devices, the certificate configured on the device must match the certificate stored in Security Manager's certificate store. Mismatched certificates will result in communication failures during policy discovery or deployment.

IPS devices use self-signed certificates that have a fixed validity period of about 2 years. When the certificate expires, you need to regenerate the certificate and update the certificate store with the new certificate.

Security Manager includes a utility that you can use to synchronize the certificate store with the certificate defined on the device, to regenerate expired certificates, and to view the status of certificates (including expiration dates) on the IPS devices that you manage.

**Tip**

If you are using HTTP for communication with the IPS devices, certificates are not used and you cannot manage them. IPS device communication settings are configured in the Security Manager Administration Device Communication page (see [Device Communication Page, page 11-16](#)).

The following procedure explains how to manage your IPS certificates with Security Manager.

## Related Topics

- [Table Columns and Column Heading Features, page 1-46](#)
- [Filtering Tables, page 1-45](#)
- [Manually Adding SSL Certificates for Devices that Use HTTPS Communications, page 9-4](#)
- [Security Certificate Rejected When Discovering Device, page 9-6](#)
- [Invalid Certificate Error During Device Discovery, page 9-6](#)

**Step 1** Select **Manage > IPS > IPS Certificates** to open the IPS Certificates dialog box.

**Tip**

The list shown in this dialog box is not automatically refreshed. Click **Refresh** whenever you open the dialog box to ensure that you are looking at the most current certificate expiration information.

The dialog box lists all IPS sensors that are in the inventory according to their Security Manager display name. Not all columns are displayed (right-click any cell heading to select additional columns). The main columns of interest are the following:

- **Certificate Mismatch?**—Whether the certificate defined on the device is the same as that in Security Manager. This field is blank if the certificate is unavailable or non-retrievable; otherwise, it can have these values:
  - **No**—The device and Security Manager have the same certificate. No action is required.
  - **Yes**—The device and Security Manager have different certificates. If the certificate has not expired, select the device and click **Sync Certificates** to replace the certificate in the Security Manager certificate store with the certificate from the device.
- **Valid Until on Device, Valid From on Device**—These two separate columns show the date range within which the certificate is valid. The certificate expires after the Valid Until date is reached. Consider regenerating the certificate as this date approaches.

- **Certificate Status on Device**—Shows the current status of the certificate as it exists on the device:
  - **Valid Certificate**—The certificate is good and within the validity date range.
  - **Expired Certificate**—The certificate has passed its Valid Until date and is now expired. Select the device and click **Regenerate Certificate** to create a new valid certificate on the device and to have the certificate loaded into the Security Manager certificate store.
  - **Certificate Not Yet Valid**—The certificate has not yet reached its Valid From date and cannot be used yet. This might indicate a mismatch between the time settings on the device and on the Security Manager server. Ensure that the time settings are the same (consider using an NTP server). Consider regenerating the certificate.
  - **Unavailable – Refresh to get Cert Info**—The certificate is not currently in the Security Manager certificate store. Click **Refresh** to have Security Manager retrieve the certificate from the device and load it into the certificate store.
  - **Nonretrievable – Cert Info not available**—Security Manager was not able to log into the device and retrieve the certificate, or you are using HTTP for communications. Select the device and click **Refresh**.

If refresh does not resolve the problem, ensure that the device is operating normally (that it is not down), and then check the device properties to ensure that correct credentials are configured for access (see [Viewing or Changing Device Properties, page 3-39](#)). If credentials are not the problem, also check the Allowed Hosts policy configured on the device and ensure that the Security Manager server is included as an allowed host (see [Identifying Allowed Hosts, page 35-7](#)). You can also log into Windows on the Security Manager server and use ping to see if there is a route between the server and the IPS device.

- **Thumbprint on CSM, Thumbprint on Device**—These separate columns show the thumbprint for the certificate in the certificate store and on the device.

**Step 2** Use any of the following buttons to perform the indicated actions. Except where indicated, if you do not select one or more devices before clicking the button, the action is performed on all listed devices, which can be time-consuming if there are a lot of IPS devices. You are warned before an operation is performed on all devices and given the option to stop it.

- **Sync Certificate**—Synchronize the certificate information in the Security Manager certificate store with the certificate on the device. The device certificate replaces the one in the certificate store.
- **Regenerate Certificate**—Generate a new certificate on the device and then load the new certificate into the certificate store.
- **Refresh**—Refresh the status information by having Security Manager contact the devices and retrieve certificate information, such as validity dates, and compare the certificate with the one in the certificate store. This action updates the Certificate Status on Device column and also determines whether there is a certificate mismatch.
- **Export**—Exports the entire certificates table to a comma-separated values (CSV) file. You cannot export less than the entire table. You are prompted for a file name and folder on the Security Manager server.

## Rebooting IPS Sensors

You can reboot an IPS sensor from Security Manager.

To reboot the sensor, select it in Device view, right-click and select **Reboot Device**. You are asked to confirm that you want to reboot.

Security Manager does not provide status information on the reboot process.

## CHAPTER 44

# Configuring IOS IPS Routers

---

Some Cisco IOS routers, such as integrated services routers (ISRs), include native IPS capabilities based on IPS 5.1 software. You can configure some basic IPS inspection on these devices to supplement IPS sensor inspection or to support small networks.

This chapter contains the following topics:

- [Understanding Cisco IOS IPS, page 44-1](#)
- [Overview of Cisco IOS IPS Configuration, page 44-3](#)

## Understanding Cisco IOS IPS

You can use Cisco Security Manager with the Cisco IOS Intrusion Prevention System (IOS IPS) to manage intrusion prevention on Cisco routers that use supported Cisco IOS Software releases 12.4(11)T2 and higher.

The Cisco IOS IPS acts as an in-line intrusion prevention sensor, watching packets and sessions as they flow through the router and scanning each packet to match any of the Cisco IOS IPS signatures. When it detects suspicious activity, it responds before network security can be compromised and logs the event through Cisco IOS syslog messages or Security Device Event Exchange (SDEE).

You can configure Cisco IOS IPS to choose the appropriate response to various threats. The Signature Event Action Processor (SEAP) can dynamically control actions that are to be taken by a signature event on the basis of parameters such as fidelity, severity, or target value rating. You can configure these actions in Security Manager through the Signatures and Event Actions policies.

When packets in a session match a signature, Cisco IOS IPS can take any of the following actions, as appropriate:

- Send an alarm to a syslog server or a centralized management interface.
- Drop the packet.
- Reset the connection.
- Deny traffic from the source IP address of the attacker for a specified amount of time.
- Deny traffic on the connection for which the signature was seen for a specified amount of time.

Cisco developed its Cisco IOS software-based intrusion-prevention capabilities and Cisco IOS Firewall with flexibility in mind, so that individual signatures could be disabled in case of false positives. Generally, it is preferable to enable both the firewall and Cisco IOS IPS to support network security policies. However, each of these features can be enabled independently and on different router interfaces.

For an overall understanding of the Cisco IOS IPS configuration process, see [Overview of Cisco IOS IPS Configuration, page 44-3](#).

This section contains the following topics:

- [Understanding IPS Subsystems and Support of IOS IPS Revisions, page 44-2](#)
- [Cisco IOS IPS Signature Scanning with Lightweight Signatures, page 44-2](#)
- [Router Configuration Files and Signature Event Action Processor \(SEAP\), page 44-3](#)
- [Cisco IOS IPS Limitations and Restrictions, page 44-3](#)

## Understanding IPS Subsystems and Support of IOS IPS Revisions

Cisco Security Manager automatically supports minor revisions of IOS IPS. To identify minor revisions that are supported, the IPS subsystem version is needed.

The IPS subsystem version is a version number used to keep track of Cisco IOS IPS feature changes. The subsystem number is show in the device properties (right-click the device and select **Device Properties**). You can also use the command **show subsys name ips** at a command line on the router that is running Cisco IOS IPS to show the detailed Cisco IOS IPS subsystem version. The 3.x subsystems are equivalent to IPS 5.x. For a list of the supported subsystems by Cisco IOS Software release, see the [Supported Devices and Software Versions for Cisco Security Manager](#) on Cisco.com for this release of Security Manager.

An IPS subsystem version is minor if the version difference is limited at postfix. For example, a revision from 3.0.1 to 3.0.2 is considered minor. For another example, 3.0.1 to 3.1.1 is also considered a minor version change. However, minor revisions that include new features are not automatically supported by Cisco Security Manager.

## Cisco IOS IPS Signature Scanning with Lightweight Signatures

The addition of Cisco IOS IPS signature scanning with lightweight signatures in Cisco IOS Release 15.0(1)M is an enhancement to Cisco IOS IPS that allows loading of larger signatures sets, without consuming significant additional memory or reducing the memory consumed by an existing signature set, by loading equivalent lighter-weight signatures. These signatures are referred to as lightweight signatures.

Security Manager can discover and tune custom signatures with LWEs on ISRs and modular access routers. Security Manager supports the following features for signatures with LWEs on ISRs and modular access routers:

- New signature types
- Signature categories
- New default signature category recognition
- New engine update levels
- Licensing status—bypassed, expired, or not installed

## Router Configuration Files and Signature Event Action Processor (SEAP)

As of Cisco IOS Release 12.4(11)T, signature definition files (SDFs) are no longer used by Cisco IOS IPS. Thus, you cannot use the deprecated built-in signature sets, 128.sdf, 256.sdf, and attack-drop.sdf, with Security Manager.

Instead, routers access signature definition information through a directory that contains three configuration files—the default configuration, the delta configuration, and the SEAP configuration. You configure the location using the **IPS > General Settings** policy.

SEAP is the control unit responsible for coordinating the data flow of a signature event. It allows for advanced filtering and signature overrides on the basis of the Event Risk Rating (ERR) feedback. ERR is used to control the level in which a user chooses to take actions in an effort to minimize false positives.

Signatures once stored in NVRAM are now stored in the delta configuration file.

## Cisco IOS IPS Limitations and Restrictions

Cisco IOS IPS routers do not support all the features that are supported by dedicated IPS sensor appliances and service modules. In addition, routers that support IOS IPS might not allocate as much memory to IPS functionality as an IPS sensor does. The following limitations and restrictions are important:

- When configuring an IOS IPS device, select only the signatures that you need. If you select all signatures that are available in Security Manager, you might exceed the memory available on the IOS IPS router and deployment can fail, the device might fail to load all of the signatures, or performance might be significantly degraded. If you encounter deployment failures, select a reduced set of signatures and then redeploy the configuration to the device.
- Virtual sensors are not supported by IOS IPS.
- When using event action filters with an IOS IPS router, only a subset of IPS actions are available for removal from an event that meets the criteria of the event action filter. For more information on available event actions, see [Filter Item Dialog Box, page 39-9](#) and [Understanding IPS Event Actions, page 39-2](#).
- IOS IPS is based on IPS Software 5.1. Therefore, features introduced in later versions of IPS Software are typically not available in IOS IPS. For example, you cannot configure the following features:
  - Global correlation.
  - Anomaly detection.
  - OS identification in the event action network identification policy.

## Overview of Cisco IOS IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on a Cisco IOS IPS router. For dedicated IPS devices, including IPS service modules installed in a router, see [Overview of IPS Configuration, page 35-5](#).

Cisco IOS IPS is a more limited feature meant for branch offices and small to medium sized networks, or to distribute IPS throughout a network. You typically cannot employ as many signatures in a Cisco IOS IPS router compared to a dedicated appliance. You also cannot configure advanced features such as global correlation, because Cisco IOS IPS is based on IPS Software version 5.1. When configuring Cisco IOS IPS devices, you are mostly configuring standard router policies, because the device is a router that is running a few IPS features. In comparison, the platform policies for IPS appliances and service modules are specific to IPS software.

**Tip**

Before configuring Cisco IOS IPS, read [Cisco IOS Intrusion Prevention System Deployment Guide](#) on Cisco.com.

- 
- Step 1** Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager. For information about required basic settings, see:
- [Setting Up SSL on Cisco IOS Routers, page 2-4](#)
  - [Setting Up SSH, page 2-5](#)
  - [Configuring Licenses on Cisco IOS Devices, page 2-12](#)
  - [Initial Preparation of a Cisco IOS IPS Router, page 44-5](#)
  - [Selecting a Signature Category for Cisco IOS IPS, page 44-6](#)
- Step 2** Add the device to the Security Manager device inventory (see [Adding Devices to the Device Inventory, page 3-6](#)). When you add the device be sure to make the following selections:
- When adding from Network or Export File, ensure that you select **IPS Policies** for policy discovery.
  - When adding from Configuration File or by Manual Definition, ensure that you select **IPS** from the **Options** list, or the device will not be IPS-capable from Security Manager's point of view.
- Step 3** Configure the IPS general settings to specify the location of the IPS files on the router. For more information, see [Configuring General Settings for Cisco IOS IPS, page 44-7](#).
- Step 4** Configure the IPS interface rules to enable IPS and to identify the interfaces on which traffic will be subject to IPS inspection. For more information, see [Configuring IOS IPS Interface Rules, page 44-8](#).
- Step 5** Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:
- [Chapter 39, "Configuring Event Action Rules"](#)
  - [Configuring Signatures, page 38-4](#)
- Step 6** Maintain the device:
- Update and redeploy configurations as necessary.
  - Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see [Managing IPS Updates, page 43-4](#).
-

## Initial Preparation of a Cisco IOS IPS Router

Before you add a Cisco IOS IPS router to the Security Manager inventory, you need to perform some preparatory steps. The white paper [Getting Started with Cisco IOS IPS with 5.x Format Signatures](#) on Cisco.com provides a step-by-step explanation of a basic configuration. Although you could do some of the steps after adding the router to Security Manager, such as configuring interface rules, you should do at least the basic steps.

The following procedure explains the steps you are required to complete in the CLI. These steps are required because Security Manager either cannot complete them, or it is simply easier to do it in the CLI (as a one-time configuration). The white paper includes additional steps that you can complete in the CLI, and Security Manager can discover your configuration when you add the device to the inventory. The more you do in CLI, the less you will have to configure in Security Manager.

**Tip**

You also must complete the basic router configuration steps as explained in [Setting Up SSL on Cisco IOS Routers, page 2-4](#), [Setting Up SSH, page 2-5](#), and [Configuring Licenses on Cisco IOS Devices, page 2-12](#). The following steps apply to the IPS configuration only.

- Step 1** Create a directory for IPS files on flash. For example, the following command creates a directory named `ips`:

```
router# mkdir ips
Create directory filename [ips]?
Created dir flash:ips
```

At this point, you can optionally configure the router to use this directory for IPS, or you can do it later in Security Manager (in the IPS > General Settings policy). Use the following commands to configure it in CLI:

```
router# configure terminal
router(config)# ip ips config location flash:ips
```

- Step 2** Configure the Cisco IOS IPS crypto key. The crypto key is used to verify the digital signature for the master signature file (`sigdef-default.xml`) whose contents are signed by a Cisco private key to guarantee its authenticity and integrity at every release.

You can obtain the CLI required for the key from <http://download-sj.cisco.com/cisco/ciscosecure/ids/sigup/5.0/ios/realms-cisco.pub.key.txt> (login to Cisco.com is required).

**Tip**

Configuring the key through the CLI is probably the easiest way to do it. Alternatively, you can configure it in Security Manager by assigning the `IOS_IPS_PUBLIC_KEY` pre-defined FlexConfig object to the router's FlexConfig policy. For more information about FlexConfigs, see [Chapter 7, "Managing FlexConfigs"](#).

- a. Open the text file and copy its contents to the clipboard (select all text then press Ctrl+C).
- b. If necessary, enter **configure terminal** at the router CLI prompt.
- c. Paste the copied text file at the router prompt.
- d. Exit configuration mode.
- e. Enter the **show run** command to confirm that the key was correctly configured.

- Step 3** Syslog is configured for IPS notifications by default. If you want to use SDEE for notifications, enable SDEE:

```
router# configure terminal
router(config)# ip ips notify sdee
```

- Step 4** Select a signature category to compile. For detailed information, see [Selecting a Signature Category for Cisco IOS IPS, page 44-6](#).

## Selecting a Signature Category for Cisco IOS IPS

Cisco IPS appliances and Cisco IOS IPS with IPS 5.x format signatures operate with signature categories. All signatures are grouped into categories; the categories are hierarchical. An individual signature can belong to more than one category. Top-level categories help to define general types of signatures. Subcategories exist beneath each top-level signature category. (For a list of supported top-level categories, use your router CLI help (?) with the **category** command.)

Router memory and resource constraints prevent a router from loading all Cisco IOS IPS signatures. Thus, it is recommended that you load only a selected set of signatures that are defined by the categories. Because the categories are applied in a “top-down” order, you should first retire all signatures, followed by “unretiring” specific categories. Retiring signatures enables the router to load information for all signatures, but the router does not build the parallel scanning data structure.

Retired signatures are not scanned by Cisco IOS IPS, so they do not fire alarms. If a signature is irrelevant to your network or if you want to save router memory, you should retire signatures, as appropriate.

Security Manager does not manage the signature category command. You cannot configure it directly with a policy. However, you can configure the FlexConfig policy to include a FlexConfig object that configures the command. There is a pre-defined object, IOS\_IPS\_SIGNATURE\_CATEGORY, that you can use. If you want to configure a different category than basic, make a copy of the object and edit it. For information on how to use FlexConfigs, see [Chapter 7, “Managing FlexConfigs”](#).

**Tip**

If you do not use the **category** command to select a subset of IPS signatures that the device will attempt to compile, Security Manager will configure the category command to enable the IOS IPS Basic category to prevent the device resources from being overloaded. You can change the category manually on the device to select another set of signatures to compile. We recommend that you configure the category before adding the device to Security Manager; however, this is not possible if you add the device through manual definition.

The following example shows how to first retire all signatures, then to configure the basic category and unretire the basic signatures:

```
Router> enable
Router# configure terminal
Router(config)# ip ips signature-category
Router(config-ips-category)# category all
Router(config-ips-category-action)# retired true
Router(config-ips-category-action)# exit
Router(config-ips-category)# category ios_ips basic
Router(config-ips-category-action)# retired false
Router(config-ips-category-action)# exit
```

## Configuring General Settings for Cisco IOS IPS

Use the General Settings page to specify the global settings used for Cisco IOS IPS properties defined for a particular router. The default settings are appropriate for most situations; however, you must specify an IPS configuration file location. If storing the configuration file on the router, you must first create the directory as described in [Initial Preparation of a Cisco IOS IPS Router, page 44-5](#).

### Navigation Path

- (Device view) Select **IPS > General Settings** from the Policy selector.
- (Policy view) Select **IPS (Router) > General Settings**, then select an existing policy or create a new one.

|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block Traffic when IPS engine is unavailable | <p>Whether to block all inspected traffic if the IPS engine is not available, for example, when the signature engine is being built or if it fails to build.</p> <p>If you select this option, any traffic specified for inspection is dropped if IPS cannot process it (also known as fail-closed mode). Otherwise, traffic is allowed to pass in accordance with the other rules in place on the router (the default).</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| Apply Deny Action On                         | <p>Where to apply ACL entries to drop traffic for Deny Attacker Inline or Deny Flow Inline events. Select one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Ingress Interface</b> (the default)—Enforce the deny action on the interface attached to the network from which the traffic originated.</li> <li>• <b>IPS enabled interfaces</b>—Enforce the deny action on the interface on which the triggered IPS rule is applied.</li> </ul> <p>Enabling this option causes IOS IPS to apply the ACLs directly to the IPS interfaces, and not to the interfaces that originally received the attack traffic. If the router is not performing load balancing, do not enable this setting. If the router is performing load balancing, we recommend that you enable this setting.</p> |
| <b>SDEE Properties</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Maximum Subscriptions                        | <p>The maximum number of concurrent SDEE subscriptions allowed, in the range of 1-3. An SDEE subscription is a live feed of SDEE events.</p> <p>The default is 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Maximum Alerts                               | <p>The maximum number of SDEE alerts that you want the router to store, in the range of 10-2000. Storing more alerts uses more router memory.</p> <p>The default is 200.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 44-1** General Settings Page (Continued)

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Messages                      | The maximum number of SDEE messages that you want the router to store, in the range of 10-500. Storing more messages uses more router memory.<br>The default is 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>IPS Config Location Properties</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IPS Config Location                   | The location where the router will save IOS IPS specific configuration files. These configuration files are automatically updated every time the IOS IPS configuration is changed or updated from Security Manager. When the router reboots, the IOS IPS configuration is retrieved and restored from these configuration files.<br><br>To specify a location on the router, enter the name of the directory. The directory must already exist; Security Manager does not create it. For example, flash:ips.<br><br><b>Note</b> If the router has a LEFS-based file system, you will be unable to create a directory in router memory. In this case, flash: is used as the config location.<br><br>To specify a location on a remote system, specify the protocol and path of the URL needed to reach the location. For example, if you want to save the config files to an HTTP server, then enter http://172.27.108.5/ips-cfg.<br><br>Supported servers for saving the IOS IPS configuration files are: http://, https://, ftp://, rcp://, scp://, and tftp://. |
| Max retries                           | When storing configuration files on a remote system, how many times the router is to attempt to contact the remote system.<br>The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Timeout seconds between retries       | When storing configuration files on a remote system, how long the router is to wait before attempting to contact the configuration location again.<br>The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configuring IOS IPS Interface Rules

Use the IPS Interface Rules policy to enable IPS inspection on Cisco IOS IPS routers and to specify the interfaces that will be subject to IPS inspection. You can identify a subset of the traffic on the interface that is subject to inspection by configuring an ACL and by specifying the traffic direction relative to the interface.

### Related Topics

- [Understanding Cisco IOS IPS, page 44-1](#)

---

**Step 1** Do one of the following to open the Interface Rules policy you want to modify:

- (Device view) Select **IPS > Interface Rules** from the Policy selector.
- (Policy view) Select **IPS (Router) > Interface Rules** from the Policy selector. Select an existing policy or create a new one.

The policy shows any existing interface rules, including the rule name, the name of the ACL that defines which traffic is inspected (if any), and the interface and traffic direction that is inspected. If no ACL is specified, all traffic on the interface in the specified direction is inspected.

Although the rules are numbered, the sequence of rules has no effect on IPS processing.

**Step 2** Select **Enable IPS** to enable the deployment of IOS IPS configuration to the device.

If Enable IPS is unchecked, IPS rules are removed from all the router interfaces, which disables IPS. Also, no signature or event action policy will be deployed.

**Step 3** Configure the interface rules. The rules identify the interfaces, and traffic direction on the interface, that will be inspected by IPS. The rules can optionally include an ACL to identify a subset of traffic for inspection.

- To add a rule, click the **Add Row (+)** button and fill in the Add IPS Rule dialog box. For detailed information, see [IPS Rule Dialog Box, page 44-9](#).
- To edit a rule, select it and click the **Edit Row (pencil)** button.
- To delete a rule, select it and click the **Delete Row (trash can)** button.

## IPS Rule Dialog Box

Use the Add or Edit IPS Rule dialog box to identify the traffic flows to be inspected using the active signature policy.

### Navigation Path

From the Interface Rules policy, click the **Add Row** button to add a new rule, or select a rule and click the **Edit Row** button. For information on opening the Interface Rules policy, see [Configuring IOS IPS Interface Rules, page 44-8](#).
